2. Project Description – Service Area

INCIDENT RESPONSE DIRECTION – EXAMINED

A three-year study investigated the direction to which Station 59 responded most often. The result of the study indicated an essentially equal number of responses in both directions. Consequently, the location of a new station in relationship to either the town or the coast was not informed by this study.

By choosing a position to the east of the flood-prone area, on Pescadero Creek Road, at the creek bridge and closer to Town would allow Community Room access to a greater number of area residents, if such a room were included in the New Fire Station program.

Business and commercial access between the town and the coast makes adopting the flooding resolution as critical to the Town's livelyhood as the other routes out of town.Stage Road to the north and Cloverdale Road to the south—both of which are long and circuitous-- impede tourism and commerce as well as firefighting response time.

one area on Pescadero Creek Rd at the Creek bridge and closer to Town would allow a better use of the Community Room if it were included in the program to develop a New Fire Station.

EXHIBIT A. PESCADERO SERVICE AREA

3. Executive Summary and Recommendations

The Team has interviewed the staff at the Fire Station and reviewed the conditions of the existing Pescadero Fire Station to gain an understanding of the current conditions of the facility, its mission and the Service Area.

The service area is indicated in Exhibit A.

There are three full-time firefighters on staff, increasing to 8 or 9 during fire season.

The team has explored several options to mitigate the known water risks at the existing site and bring the facility up to current requirements for its mission.

The options that were considered range from:

Option A: Provides for a new fire station to meet all current criteria by locating an acceptable site near the Town of Pescadero and rebuilding a new, code-compliant, and efficiently operated facility. This site should not be located in the flood plain or in the Tsunami Inundation Zone, as well as outside the limits of 50 year predicted sea level rise (and ideally beyond this limit) in order to protect the investment in the improved facility and properly uphold the public safety mission of the station (see Section 3.1).

Option B: Provides for a new Living Quarter and Command Office area adjacent to a remodeled Apparatus Building, while working within the existing site as it remains open and occupied as a fire station. This appears to provide the most cost effective way to improve the facility's ability to support its mission, but with the understanding that all water risks cannot be mitigated (see Section 3.2).

Option C: Provides for a new Living Quarter and Command Office area adjacent to a remodeled Apparatus Building after temporarily relocating the firefighting services and staff to a location at Pescadero High School Working within the existing site, site provides the most easily constructed improvements project, Again, we emphasize that all water risks cannot be mitigated. This option appears to be more expensive than Option B and was not developed.

Variations of this Option B to save the current site were considered, but it appears that a two phased approach to improvements can be made while allowing staff and equipment to remain on-site. This is the lowest cost approach for this theme. This concept should be verified with a qualified, licensed general contractor to consider all implications of a phased construction sequence that meets all safety requirements for the station, the staff, and the mission should this option be selected to pursue further. It appears that a site access plan for firefighters and the contractor—as well as appropriate construction staging areas—could be developed.

3.1 Option A: New Site.

After completion of Improvements Planning and Cost Analysis for Option B (work with the existing site) and its variations, the team developed the ideas for a new site (location TBD) with the right sized and code compliant station best suited for an efficient operation.

The Team arrived at an optimal space and equipment program after an intensive daylong programming session at the fire station which involved senior firefighter and County Public Works staff. Minor growth in staffing was concluded on, with slow growth in structures predicted for this service area. No apparatus growth was assumed to be necessary at this time, though the placement of the water tender at this site may increase the need for a 4th vehicle bay. This possibility was considered in the conceptual cost estimating and planning by moving the physical training area into a space that had been set aside for a Community Room option that is not present in the current station. This community space was considered a strong asset of consideration if a new station development is to be undertaken. If the water tender is to be kept at this site AND the Community Room option is to be pursued, the programmed area should be increased and reflected in an increased construction budget. This topic needs further discussion.

The station allows for a second floor Living Quarters housed over Command Center, staff offices and the Community Room, both located on the ground level. All spaces are contiguous for an efficient operation. The attached (2) deep apparatus high bays have dual sided access through bi-folding doors and house (3) vehicles and space for physical training and a work shop, convertible to (4) vehicles. The site can park up to (12) staff autos, and (12) public autos. The site can turn around a firefighting vehicle with a 55-foot turning radius, though the maximum radius needed is probably less.

The project consists of a new two-story 8,900 SF fire station with living quarters over offices adjacent to apparatus bays. Sitework includes vehicular and pedestrian paving, landscaping, site lighting and drainage, new emergency generator and fuel storage tanks. Utilities include incoming City water, storm drain and electrical service. Sewer is provided by an onsite septic system, gas is provided by propane tanks.

The projected New Station criteria:
Minimum Site Area: 39,775 SF
Minimum Building Area: 8,100 GSF
Massing: Two-story Living Quarters over Command Center and Offices
Emergency Operations design criteria met.
Programmed area includes room for indoors housing of up to:

- 12 firefighters
- 3 firefighting vehicles
- Community Room (doubles as area needed to meet EOC criteria).
- Design Character (see Zoning requirements in Section 6.1 Architectural)
- Patterned after a Rural Agricultural Structure.
- Clean simple lines
- Steep pitched roof
- Symmetrical opening where possible
- Metal Siding and Roofing or other durable material.

Projected Construction Cost: $5,139,058 (without land cost)

See Section 6. Diagrams:
Site Plan: SK A1
Floor Plans: SK A2

3.2 Option B: Existing Site, with Programmatic Improvements.

The Team arrived at an appropriate space and equipment program after an intensive daylong programming session at the fire station which involved senior firefighter and County Public Works staff. Minor growth in staffing was concluded on, with only slow growth in structures predicted in this service area. Apparatus growth was assumed unnecessary at this time, though the placement of the water tender at this site may increase the need for a 4th vehicle bay. See additional notes in Option A.

The station allows for a second floor Living Quarters to be housed over the command center, staff offices and the community room on the ground level. All spaces are contiguous for an efficient operation.

The original apparatus building steel frame and concrete pad remains. All other aspects of the facility are demolished as they are not code compliant or are at the end of useful life, For details, see Section 5. Site Assessment Reports and Section 8. Appendices.

The existing detached apparatus high bays [would]have single sided access through new bi-folding doors and house (3) vehicles, with space for physical training and a work shop. It is convertible to (4) vehicles. The site can park up to (12) staff autos, and (9) public autos. The site cannot turn around a firefighting vehicle with a 55’ turning radius though the maximum radius needed is probably less.

Project consists of replacing existing living quarters building with a new two-story 5,508 SF Living Quarters building, complete interior/exterior renovation to the existing 2,400 SF apparatus building, including a new 1,100 SF addition. Sitework includes vehicular and pedestrian paving, landscaping, site lighting, drainage, and replacement of the existing emergency generator and fuel storage tanks. Utilities include septic system replacement and connecting existing utilities to new buildings.

The projected Station Programmatic Improvements criteria:
Current Site Area: 56,062 SF
Minimum Building Area: 8,900 GSF
Massing: 2 story Living Quarters over Command Center and Offices,
Adjacent to existing 1 story Apparatus Building with rear addition.
Emergency Operations design criteria met.
Programmed area includes room for indoors housing of up to:

- 12 firefighters
- 3 firefighting vehicles
- Community Room (doubles as area needed to meet EOC criteria).

Design Character (see Zoning requirements in Section 6.1 Architectural)

- Patterned after a Rural Agricultural Structure.
- Clean simple lines

- Steep pitched roof
- Symmetrical openings where possible
- Metal Siding and Roofing or other durable material.

Projected Construction Cost: $5,728,568

Option B - Site Phasing:

Firefighting Operations remain active on site during construction.

Phase 1: build New 2 Story Addition:
- Demo or relocate temporarily storage containers and sheds on west side
- Demo AC driveway and, possibly, (2) Monterey Pine trees
- Relocate utilities as needed
- Build (2) story New Addition, with Living Quarters over the Offices
- Build New Patio 12'x20' with cover roof to west and outdoor BBQ.

Phase 2A: Move staff into New Addition:
- Relocate new command center from Apparatus Building into New Addition offices on first level
- Move into Living Quarters and Offices
- Demo existing Living Quarters.

Phase 2B: Renovate Apparatus Building.
- Relocate vehicles to paved yard, possibly under tent structures
- Relocate turnout gear and supplies to storage mods or into first floor of New Addition
- Demo all interior construction in eastern most bay of Apparatus Building
- Demo rear wood frame addition of Apparatus Building
- Demo Apparatus Building exterior siding and roof
- Build Apparatus Building New Addition: 10' wide, full length of the rear of existing steel prefab bldg. Metal stud on-slab, on-grade construction, same skin and roof as below. 10' min height, 3/12 pitch
- Verify site drainage to hillside cut on south side. Provide additional cut and hillside stabilization, with a keystone wall if required.
- Apply new exterior walls to Apparatus Building (sheet metal siding over sheathing, membrane, new metal studs, interior gyp board)
- Rebuild Apparatus Building roof (sheet metal siding over sheathing, membrane, new plywood, verify existing framing)
- Provide (4) new bi-fold vehicle garage doors on auto operators
- Provide new floor seal for all Apparatus Building. areas, "gym flooring" at west bay, and new, 1-hour rated gyp board on metal stud partition walls to separate new physical training area from new shop and apparatus bays. Include rated doors.
- Provide all new MEP for the Apparatus Building. New Heat/Vent/Vehicle exhaust snorkels/no AC. All new lighting, power, and AV.

3.2 Option B: Existing Site, with Programmatic Improvements – VARIATIONS

The current site could possibly be isolated from Hwy 1 and the coastal areas it serves if a Tsunami

or flooding occurs during an incident requiring emergency response. A separate study for the consideration of a mobile command center of this site should be undertaken.

For the variety of situations that could be faced in this remote fire station, this type of vehicle may be more useful than additional real estate, which would need to be maintained. New real estate would become a fixed asset in a large service area with multiple potential risk types. A custom command vehicle that can house up to 3-4 firefighters, rescue equipment, and wireless communications should be programmed and priced for further consideration before a remote mini-station project is under taken.

5. Existing Site Analysis

5.0 Water risks Assessment

The Pescadero Fire Station Assessment Study is driven by the known water risks associated with its location on the Pescaedro and Butano Creek drainage plains and its proximity to the Pacific Ocean Coast. These risks include: seasonal flooding caused by proximity to the Creeks, which could be worsened by rising sea levels due to climate change (see Appendix 8.0), and/or a tsunami event (see Appendix 8.0) due to the potential of earthquake events.

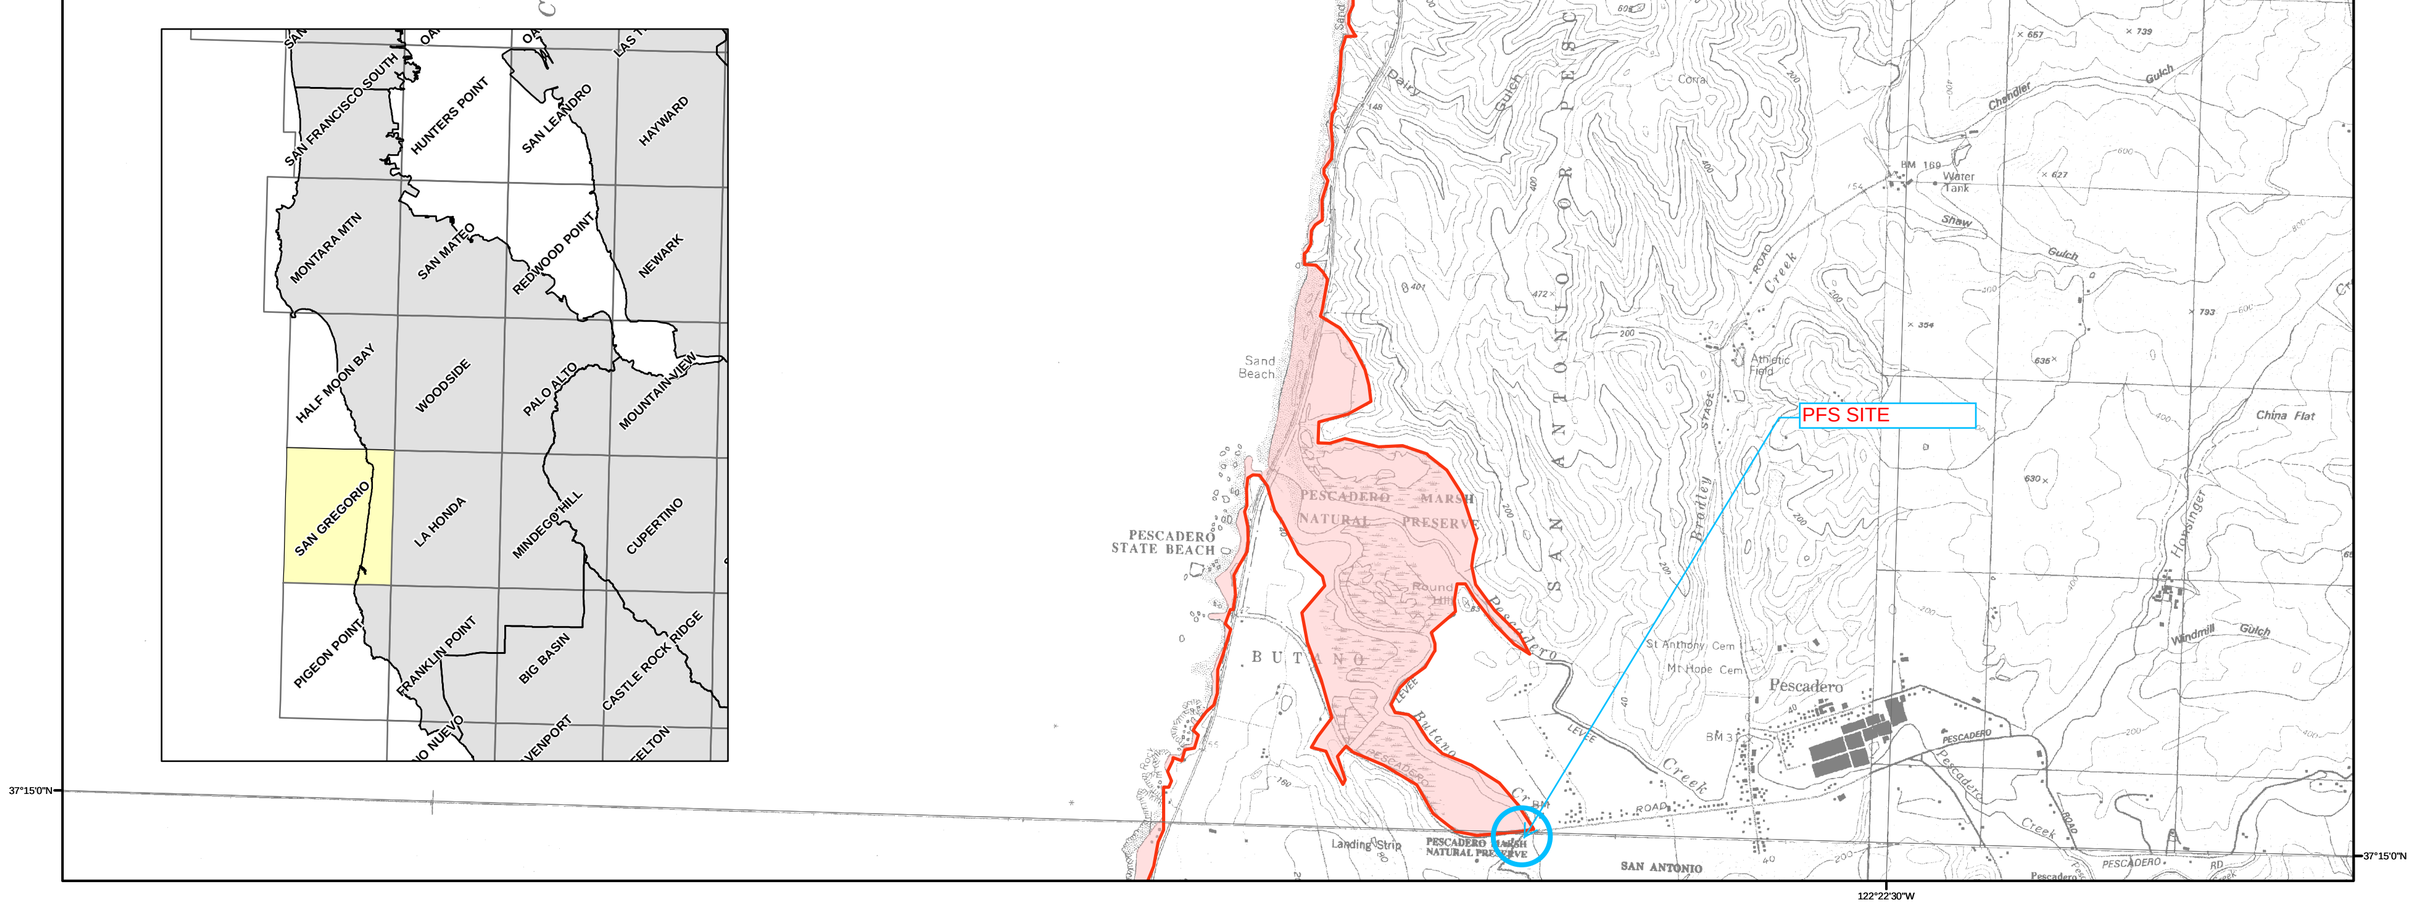
The latter two pose risk categories unto themselves and both have ongoing research with still-indeterminate predictions, but remain as known risks to this site.

The working area of this site (developed for buildings and emergency vehicles) is currently between elevation +13 and +16 ft above mean Sea level. A portion of the site on the SW corner rises up a hill and is not useable for general re-development of the fire station.

After reviewing current studies on the three types of water risks (see Appendices), it appears that the seasonal flooding of the site is most the controllable of the three and yet is mired in determining the final mitigation solution and permitting process (see Appendices). A solution could entail an extensive first Phase of study of the civil engineering within the drainage plain systems and with possible adjacent road work. This study needs to be completed before an additional study as to what affect this first Phase will have on the correct direction for the Fire Station site on Pescadero Creek Road.

In lieu of these studies, the current Assessment Report has taken the approach that the site cannot be easily raised, without a companion work scope that also raises the adjacent roads or other solution in the creek drainage plain. This variable has been set aside and our Team has completed a standalone review of the existing facilities for appropriateness to their firefighting/emergency response mission in terms of operations and their physical condition. The results have then been used to predict what would be needed to bring them into compliance for their intended mission, pending a solution to the seasonal flooding risk which is believed to be achievable. What is missing then is: at what elevation will the new work at the site be set? While this question remains unanswered, within the context of the entire Assessment Report, we still can recommend not continuing to develop this site due to all the water risks associated with this site.

If the seasonal flooding risk is mitigated at this site, it still does not diminish the other two important water risks: rising seal levels and tsunami events, which make vulnerable this site serving its mission.



METHOD OF PREPARATION

Initial tsunami modeling was performed by the University of Southern California (USC) Tsunami Research Center funded through the California Emergency Management Agency (CalEMA) by the National Tsunami Hazard Mitigation Program. The tsunami modeling process utilized the MOST (Method of Splitting Tsunamis) computational program (Version 0), which allows for wave evolution over a variable bathymetry and topography used for the inundation mapping (Titov and Gonzalez, 1997; Titov and Synolakis, 1998).

The bathymetric/topographic data that were used in the tsunami models consist of a series of nested grids. Near-shore grids with a 3 arc-second (75- to 90-meters) resolution or higher, were adjusted to "Mean High Water" sea-level conditions, representing a conservative sea level for the intended use of the tsunami modeling and mapping.

A suite of tsunami source events was selected for modeling, representing realistic local and distant earthquakes and hypothetical extreme undersea, near-shore landslides (Table 1). Local tsunami sources that were considered include offshore reverse-thrust faults, restraining bends on strike-slip fault zones and large submarine landslides capable of significant seafloor displacement and tsunami generation. Distant tsunami sources that were considered include great subduction zone events that are known to have occurred historically (1960 Chile and 1964 Alaska earthquakes) and others which can occur around the Pacific Ocean "Ring of Fire."

In order to enhance the result from the 75- to 90-meter inundation grid data, a method was developed utilizing higher-resolution digital topographic data (3- to 10-meters resolution) that better defines the location of the maximum inundation line (U.S. Geological Survey, 1993; Intermap, 2003; NOAA, 2004). The location of the enhanced inundation line was determined by using digital imagery and terrain data on a GIS platform with consideration given to historic inundation information (Lander, et al., 1993). This information was verified, where possible, by field work coordinated with local county personnel.

The accuracy of the inundation line shown on these maps is subject to limitations in the accuracy and completeness of available terrain and tsunami source information, and the current understanding of tsunami generation and propagation phenomena as expressed in the models. Thus, although an attempt has been made to identify a credible upper bound to inundation at any location along the coastline, it remains possible that actual inundation could be greater in a major tsunami event.

This map does not represent inundation from a single scenario event. It was created by combining inundation results for an ensemble of source events affecting a given region (Table 1). For this reason, all of the inundation region in a particular area will not likely be inundated during a single tsunami event.

MAP EXPLANATION

Tsunami Inundation Line

Tsunami Inundation Area

PURPOSE OF THIS MAP

This tsunami inundation map was prepared to assist cities and counties in identifying their tsunami hazard. It is intended for local jurisdictional, coastal evacuation planning uses only. This map, and the information presented herein, is not a legal document and does not meet disclosure requirements for real estate transactions nor for any other regulatory purpose.

The inundation map has been compiled with best currently available scientific information. The inundation line represents the maximum considered tsunami runup from a number of extreme, yet realistic, tsunami sources. Tsunamis are rare events; due to a lack of known occurrences in the historical record, this map includes no information about the probability of any tsunami affecting any area within a specific period of time.

Please refer to the following websites for additional information on the construction and/or intended use of the tsunami inundation map:

State of California Emergency Management Agency, Earthquake and Tsunami Program: http://www.oes.ca.gov/WebPage/oeswebsite.nsf/Content/B1EC51BA215931768825741F005E8D80?OpenDocument

University of Southern California – Tsunami Research Center: http://www.usc.edu/dept/tsunamis/2005/index.php

State of California Geological Survey Tsunami Information: http://www.conservation.ca.gov/cgs/geologic_hazards/Tsunami/index.htm

National Oceanic and Atmospheric Agency Center for Tsunami Research (MOST model): http://nctr.pmel.noaa.gov/time/background/models.html

MAP BASE

Topographic base maps prepared by U.S. Geological Survey as part of the 7.5-minute Quadrangle Map Series (originally 1:24,000 scale). Tsunami inundation line boundaries may reflect updated digital orthophotographic and topographic data that can differ significantly from contours shown on the base map.

DISCLAIMER

The California Emergency Management Agency (CalEMA), the University of Southern California (USC), and the California Geological Survey (CGS) make no representation or warranties regarding the accuracy of this inundation map nor the data from which the map was derived. Neither the State of California nor USC shall be liable under any circumstances for any direct, indirect, special, incidental or consequential damages with respect to any claim by any user or any third party on account of or arising from the use of this map.

GENERAL PLAN (1986)
http://planning.smcgov.org/documents/local-coastal-program-lcp

Local Coastal Program Area (1980), Rural Service Centers
DESIGNATION: Institutional Land Use
Bounded by General Open Space (OS), Public Recreation (marsh), Private lands

Local Coastal Program (LCP)
All development in the Coastal Zone requires either a Coastal Development Permit or an exemption from Coastal Development Permit requirements. For a permit to be issued, the development must comply with the policies of the Local Coastal Program (LCP) and those ordinances adopted to implement the LCP. The project must also comply with other provisions of the County Ordinance Code, such as zoning, building and health regulations.

LOCAL COASTAL PROGRAM POLICIES (verify):

> *LOCATING AND PLANNING NEW DEVELOPMENT COMPONENT*
> *DEVELOPMENT REVIEW*
> *1.1 Coastal Development Permits*
> *After certification of the Local Coastal Program (LCP), require a Coastal Development Permit for all development in the Coastal Zone subject to certain exemptions.*
>
> *1.2 Definition of Development*
> *As stated in Section 30106 of the Coastal Act, define development to mean:*
> *On land, in or under water, the placement or erection of any solid material or structure; discharge or disposal of any dredged material or any gaseous, liquid, solid, or thermal waste; grading, removing, dredging, mining, or extraction of any materials; change in the density or intensity of use of land, including, but not*

limited to, subdivision pursuant to the Subdivision Map Act (commencing with Section 66410 of the Government Code), and any other division of land, including lot splits, except where the land division is brought about in connection with the purchase of such land by a public agency for public recreational use; change in the intensity of use of water, or of access thereto; construction, reconstruction, demolition, or alteration of the size of any structure, including any facility of any private, public, or municipal utility; and the removal or harvesting of major vegetation other than for agricultural purposes, kelp harvesting, and timber operations which are in accordance with a timber harvesting plan submitted pursuant to the provisions of the Z'berg-Nejedly Forest Practice Act of 1973 (commencing with Section 4511).

As used in this section, "structure" includes, but is not limited to, any buildings, road, pipe, flume, conduit, siphon, aqueduct, telephone line, and electrical power transmission and distribution line.

ITEMS to be verified include:

Appendix 1.A
Minimum Stormwater Pollution Prevention Requirements
Pages 1.27 thru 1.30

Items Apply to PFS: 3.c; 3.e, 3.f, 3.j
Verify that current septic field location would not be allowed by this standard: Items 3.i and 3.j.

3. Developments of Special Concern
j. On-site sewage treatment systems (septic systems) shall be sited away from areas that have poorly or excessively drained soils, shallow water tables or high seasonal water tables that are within floodplains or where effluent cannot be adequately treated before it reaches streams or the ocean. New development with conventional or alternative on-site sewage treatment systems shall include protective setbacks from surface waters, wetlands and floodplains, as well as appropriate separation distances between on-site sewage treatment system components, building components, property lines, and groundwater as required by the Regional Board. Under no conditions shall the bottom of the effluent dispersal system be within five (5) feet of groundwater.

SENSITIVE HABITATS
WETLANDS:
Page 7.5
Site is adjacent to protected Wetland.

7.15 Designation of Wetlands
a. Designate the following as wetlands requiring protection: Pescadero Marsh,…

Page 7.6
Verify if current site and proposed development in Option B are outside of required

Buffer Zone.

7.18 Establishment of Buffer Zones
Buffer zones shall extend a minimum of 100 feet landward from the outermost line of wetland vegetation. This setback may be reduced to no less than 50 feet only where: (1) no alternative development site or design is possible; and (2) adequacy of the alternative setback to protect wetland resources is conclusively demonstrated by a professional biologist to the satisfaction of the County and the State Department of Fish and Game. A larger setback shall be required as necessary to maintain the functional capacity of the wetland ecosystem.)

Page 7.7
7.21 Management of Pescadero Marsh

Other items may apply.

VISUAL RESOURCES:

Verify if these Design Guidelines apply to institutional buildings constructed after April 29, 1998 at this site for proposed development in Option B:

Provisional Appendix - In-Progress Development Proposals Not Affected
by the LCP Amendments Certified by the
Coastal Commission on April 29, 1998 .....PA.1-PA.13

8.13 Special Design Guidelines for Coastal Communities Pages PA.9 thru PA.13
d. Pescadero
Encourage new buildings to incorporate architectural design features found in the historic buildings of the community (see inventory listing), i.e., clean and simple lines, precise detailing, steep roof slopes, symmetrical relationship of windows and doors, wood construction, white paint, etc.
Require remodeling of existing buildings to retain and respect their traditional architectural features, if any.

Note:
Other items may apply if the Option A - New Site approach is determined and defined.

DESIGNATION: PAD/CD (combined districts)
Planned Agricultural Districts/Coastal Development Districts

Items Apply:

CHAPTER 20A.2. DEVELOPMENT REVIEW CRITERIA

(applicable sections, partial list)

- SECTION 6325.2. PRIMARY FISH AND WILDLIFE HABITAT AREAS CRITERIA.
- SECTION 6325.7. PRIMARY NATURAL VEGETATIVE AREAS CRITERIA.
- SECTION 6326. SUPPLEMENTARY REVIEW CRITERIA FOR SPECIAL HAZARD
- SECTION 6326.1. FLOOD PLAIN AREA CRITERIA.

Verify that Option B development is permitted per:

- SECTION 6326.2. TSUNAMI INUNDATION AREA CRITERIA. The following criteria shall apply within all areas defined as Tsunami Inundation Hazard Areas. (a) The following uses, structures, and development shall not be permitted: publicly owned buildings intended for human occupancy other than park and recreational facilities; schools, hospitals, nursing homes, or other buildings or development used primarily by children or physically or mentally infirm persons.
- SECTION 6326.3. SEISMIC FAULT/FRACTURE AREA CRITERIA.

CHAPTER 20B. "CD" DISTRICT

(COASTAL DEVELOPMENT DISTRICT)

SECTION 6328.4. REQUIREMENT FOR COASTAL DEVELOPMENT PERMIT.

Except as provided by Section 6328.5, any person, partnership, corporation or state or local government agency wishing to undertake any project, as defined in Section 6328.3(r), in the "CD" District, shall obtain a Coastal Development Permit in accordance with the provisions of this Chapter, in addition to any other permit required by law. Development undertaken pursuant to a Coastal Development Permit shall conform to the plans, specifications, terms and conditions approved or imposed in granting the permit.

SECTION 6328.5. EXEMPTIONS.

The projects listed below shall be exempt from the requirement for a Coastal Development Permit. Requirements for any other permit are unaffected by this section.

(b) The maintenance, alteration, or addition to existing structures other than single family dwellings and public works facilities; however, the following classes of development shall require a permit because they involve a risk of adverse environmental impact:

(3) The expansion or construction of water wells or septic systems.

(4) On property located between the sea and the first public road paralleling the sea or within 300 feet of the inland intent of any beach or of the mean high tide of the sea where there is no beach, whichever is the greater distance, or in scenic road corridors, an improvement that would result in an increase of 10% or more of external floor area of the existing structure, and/or the construction of an additional story (including lofts) in

an existing structure.

CHAPTER 21A. "PAD" DISTRICT
(PLANNED AGRICULTURAL DISTRICT)
This chapter has sections that may apply to Option A - New Site development location.

SECTION 6353. USES PERMITTED SUBJECT TO THE ISSUANCE OF A PLANNED AGRICULTURAL PERMIT.

The following uses are permitted in the PAD subject to the issuance of a Planned Agricultural Permit, which shall be issued in accordance with the criteria set forth in Section 6355 of this ordinance. Applications for Planned Agricultural Permits shall be made to the County Planning Commission and shall be considered in accordance with the procedures prescribed by the San Mateo County Zoning Ordinance for the issuance of use permits and shall be subject to the same fees prescribed therefore.

B. On Lands Suitable for Agriculture and Other Lands

6. Fire stations.

Site Visit

The Architectural Team worked on October 28, 2012 and the entire A+E Consultant Team worked on November 20, 2013 to complete assessments on the PFS site at 1200 Pescadero Creek Road.

This included a brief tour of potential replacement or remote sites in and around the Town of Pescadero.

Existing site features

- The site is partially surrounded by a 6 foot high wood fence for visual screening.
- No security fence or gates are present.
- The site has a steep hill in the southwest corner.
- Site pavement generally consists of asphalt, depth and section is unknown.
- Concrete pavement is found at the vehicle wash area, fuel station and certain pedestrian building access points; sections are unknown.
- No recent site survey was performed or is currently available through the SM County
- GIS system.

Relative topo information was located here:

- smc-400 Scale Contour-grid-22D.pdf (SM Cty GIS system).

Additional relative topo information was taken from Google Earth Pro:

- Pescadero Cr_els at 1200 & 5631.pdf

The site has Monterey Pine trees – see Google Earth map.

Existing structures

- Living Quarters (barracks), dated: 1/7/1957

    - 2175 GSF
    - 1789 ASF
    - Wood frame, Type 5 construction
    - Composition Shingle roof
    - Interiors are well-maintained but worn in the restrooms, kitchen and dining areas.
    - This building has been flooded more than 3 times in recent memory and has been repaired each time. Standing water and contaminated soil were visible in the crawl space the day of our inspection.
    - An addition was built by the station staff in the early 1980's to enclose the original porch to create additional space in the Dayroom ("recreation room" per original drawings).
    - ADA non-compliant.
    - Operationally, the ideal set up is to have the Living Quarters adjacent to the Command Office and Apparatus Building to improve response time and not across the service yard as is currently.
    - This building has no provision for Community space or interface - and is inadequate for training or as an Emergency Operations Center (EOC) by current standards.
    - Finish Floor elevation is approximately 15'.
- Apparatus Building (barracks), dated: 1/7/1957
    - 3128 GSF
    - 1789 ASF
    - Steel frame superstructure – non protected, wood frame infill, Type 5 construction, and not fire-sprinklered.
    - Sheet metal roof and stained wood siding appear well maintained.
    - Interiors are worn in all areas but Command Offices are well maintained.
    - The interior loft space above the Command Office is used for supplies storage and is only accessible by site built wooden wall ladder. This arrangement is unsafe and not per Code.
    - A rear wood frame addition was built in the early 1980's to create space for a physical training area. It is damp and cramped and not isolated from the apparatus bays and has shared air quality. It is not ideally sized and is without daylight, proper height and MEP systems appropriate to its function.
    - ADA non-compliant
    - Operationally, the ideal set up is to have the Apparatus Building adjacent to the Command Office/ Living Quarters to improve response time and not across the service yard as is currently.
    - This building has no provision for Community space or interface - and is inadequate for training or as an Emergency Operations Center (EOC) by current standards.
    - Finish Floor elevation is approximately 16'.

- Equipment Sheds – to create additional covered and secure storage capacity.
    - 335 GSF
    - 325 ASF
    - Steel shipping container (190 GSF) (age ?)
    - Wood frame, prefab – non protected, Type 5 construction (80 GSF), w/a rear, wood-frame addition – non protected, Type 5 construction (64 G)

        - [appears to have been built in the 1990's (verify date)]
        - Composition Shingle roof (age : 20 yrs + ?)
    - ADA non-compliant
    - These structures are inadequate as part of an Emergency Operations Center (EOC) by current standards.
    - The wood siding and metal enclosure siding is worn and damaged by earth contact in places. These have no permanent foundations, lighting or HVAC systems.
    - Finish Floor elevations is approximately 16'.

- Hazardous Materials Shed
    - 113 GSF
    - 85 ASF
    - CMU walls, wood frame roof – non protected, Type 5 construction
    - Composition Shingle roof (age : 20 yrs + ?)
    - ADA non-compliant
    - Condition appears acceptable but should be re-sealed at exterior wall surfaces.
    - Finish Floor elevations is approximately 16'.

- Emergency Generator Shed
    - 102 GSF
    - 89 ASF
    - Wood frame – non protected, Type 5 construction
    - Appears to have been built in the early 1980's (verify date)
    - Composition Shingle roof (age : 20 yrs + ?)
    - Composition Shingle roof (age : 20 yrs + ?)
    - ADA non-compliant
    - Finish Floor elevations is approximately 14'.

Note:
For all structures, see Engineer Reports below for status of building systems.

5.2 Structural Assessment

Refer to Appendix 8.2 for complete consultant's report.

A building structural assessment per *ASCE 41: Seismic Rehabilitation of Existing Buildings* was conducted. Aspects of building performance that are considered include structural, nonstructural, and foundation/geologic hazard issues. Lifelines such as water, electrical, gas and waste, etc., beyond the perimeter of the building are not considered.

5.2.1 Barracks Building

An ASCE 41-13 Life Safety basic checklist evaluation identifies the structure as being predominately compliant. Unknown factors of liquefaction and surface fault rupture which need to be review by a Geotechnical engineer. The Barracks building is part of an emergency response facility. Therefore an Immediate Occupancy performance level is required. An ASCE 41-13 Immediate Occupancy checklist evaluation for W1 structures identified a number of noncompliant items. These identified issues are all minor in nature and could be retrofitted without significant cost.

The major compliance issue with achieving an Immediate Occupancy building performance level is the structure being located in an area subject to flooding. Flooding will damage the structure and will render the building inoperable during the period of the flood, which would make an Immediate Occupancy performance level difficult to achieve even after a structural retrofit.

5.2.2 Apparatus Building

An ASCE 41-13 Life Safety basic checklist evaluation identifies the structure as being predominately noncompliant or unknown. Some of these identified issues are a mezzanine structure not being independently braced and no confirmation that the original steel system has capacity for the various additions. The Apparatus building is part of an emergency response facility. Therefore an Immediate Occupancy performance level is required. An ASCE 41-13 Immediate Occupancy checklist evaluation for S3 structures identified a number of noncompliant items. It would be anticipated that the identified issues would be major in nature and could be a challenge to retrofit without significant cost.

Two additional compliance issues required to achieve an Immediate Occupancy building performance level are the structure being located in an area subject to flooding and being located adjacent to a slope.

5.3 Mechanical, Electrical, Plumbing, IT Assessment

Refer to Appendix 8.3 for complete consultant's report.

5.3.1 Electrical Systems Existing Conditions

Most of the electrical equipment, including the standby generator (see EE2), and automatic transfer switch (see EE3), has been in use for more than thirty years. The coastal climate, severe weather conditions, and some flooding have caused rusting of the enclosed outdoor service entrance equipment (see EE1). Many broken, inadequate, or unsafe electrical conditions are noted in the report (Appendix 8.3).

5.3.2 Plumbing and Mechanical Systems Existing Conditions

The septic tank floods periodically, requiring station personnel to rent and use portable toilet facilities when the septic system is being repaired and cleaned. Fuel tanks show rust and evidence of leakage. Mechanical ventilation to occupied spaces is missing or inadequate. Some rooms have not heat. The consultant recommends demolishing all existing mechanical, plumbing, fuel, and electrical systems.

5.4 Civil Assessment

The site and buildings are outdated and in need of improvement, either at the existing site, or at a new site, in order to meet current standards and to adequately serve its community. The Pescadero Fire Sta. is located in the flood plain of the Butano Creek (see “Pescadero Floodway Map” attached, Appendix 8.4) The site is has experienced an increase in the occurrence of flooding since the mid 1980’s due to the accumulation of silt and debris in Butano Creek and Pescadero Marsh as a result of halted dredging operations.

Civil utilities on-site consist of domestic water served by the local water service municipality. The septic system is reported to back-up during flood events, which is to be expected. A new septic system will likely be required. Because the location of the existing system becomes inundated with water during flood events (see Appendix 8.4, Photo 1), it is unlikely that this location will meet code. As such, alternative locations on site should be considered.

7. Cost Analysis

Options Analyzed

The project consists of Two Options:

Option A (New Site): Project consists of a new two-story 8,904 SF fire station with living quarters and apparatus bays. Sitework includes vehicular and pedestrian paving, landscaping, site lighting and drainage, new emergency generator and fuel storage tanks. Utilities include incoming water, storm drain and electrical service. Sewer is provide by an onsite septic system, gas is provided by propane tanks.

Option B (Existing Site): Project consists of replacing existing living quarters building with a new two-story 5,508 SF living quarters building, complete interior/exterior renovation to the existing 2,400 SF apparatus building, a new 1,100 SF addition to the existing apparatus building. Sitework includes vehicular and pedestrian paving, landscaping, site lighting and drainage, replacement of existing emergency generator and fuel storage tanks. Utilities include septic system replacement, distribution of utilities to buildings.

Cost summaries extracted from the full report are given on the following pages.

Basis for Pricing

Refer to full analysis given in Appendix 8.1. This estimate reflects the fair construction value for this project and should not be construed as a prediction of low bid. Subcontractor's markups have been included in each line item unit price. Subcontractor's markups typically range from 15% to 25% of the unit price depending on market conditions. This cost estimate is based on standard industry practice, professional experience and knowledge of the local construction market costs.

The Annual Flooding of Pescadero Creek Road

Issue | Background | Findings | Conclusions | Recommendations | Responses | Attachments

Issue

For over 25 years the main road into Pescadero has been blocked by the annual flooding of Butano Creek, jeopardizing public safety and impeding access by public safety officers and medical responders into and out of the Pescadero community. Why has the County not resolved this problem and how can it finally be fixed?

Summary

The blockage of Pescadero Creek Road, in the unincorporated community of Pescadero, happens one or more times each rainy season, often for days each time. Flooding jeopardizes the safety of local citizens in two primary ways: First, alternative routes into the Pescadero area are along much longer, narrower roadways requiring at least two to three times more driving time from the coastal highway. In the case of emergencies where the San Mateo County Sheriff, CAL FIRE or the California Highway Patrol is required, response time is critical and delays can impact personal safety of citizens and their property. Second, as the road floods, there are always some individuals who deliberately or inadvertently drive through the flooded road areas, sometimes successfully, sometimes not. A flooded road impacts local commerce, tourist traffic, and agribusiness in the area, and often leaves debris and silt to clean up.

The flooding is linked to decades of silt accumulation in the streambed, and excess vegetation growth and debris build-up along Butano Creek and in Pescadero Marsh. The drainage from the Marsh into the sea, and associated flushing of silt into the sea, is compromised by natural and man-made changes. These include logging debris, erosion, run-off, levees and channels built to facilitate agriculture, as well as certain now-abandoned modifications intended to correct watershed problems. The bottom line is that rains cannot be contained within Butano Creek's banks, resulting in predictable and dangerous road flooding.

The San Mateo County Civil Grand Jury recommends the removal of excess silt and clearance of vegetation overgrowth and debris from as much of the Butano Creek as necessary to eliminate the road flooding by October 1, 2012, before the 2012/2013 rainy season, using the regulatory framework of "Emergency" action if necessary.

Background

Since the 1880s, the town of Pescadero, population ~650, has been a farming and ranching community. The town is located at the upstream (eastern) edge of Pescadero Marsh, at the confluence of Pescadero and Butano Creeks, both of which empty into the Pacific.

The flooding of the Pescadero Creek Road at the Butano Creek Bridge closes the main route into and out of Pescadero, while simultaneously inundating privately owned farmlands. The road closure isolates the town and surrounding areas from its CAL FIRE Station, severely impacting emergency services. Alternate roads are small and winding through local hills. An ambulance, fire engine, or police vehicle could require an extra hour or more in transit time. In recent years, flooding has occurred several times during the rainy season, often for 24-48 hours at a time.

Several sources document the history and complexities of the Pescadero watershed. [1] The cause of the annual flooding includes progressive silt accumulation and vegetation overgrowth and debris build-up in Butano Creek up- and down-stream of the Bridge and beyond into the Marsh itself. Additionally, numerous property owners decades ago created levees and channels in the marsh for their land-uses, and several projects for the Coastal Highway have modified the seasonal sand-berm that affects the Butano Creek's flow from the Marsh to the Ocean. State regulations enacted beginning in the 1960s have prevented property owners from dredging and clearing creeks on their property and opening the sand-berm as they had historically done.[2]

Survey profiles demonstrate the silt build up. (*See*, Attachment A.) The streambed was ~12 feet below the bottom of the bridge in 1968.[3] Currently the bridge clears the silted creek bottom by only two feet. The creek has no capacity to handle rainstorm run-off; the water has nowhere to go but up and over the road.

The California Department of State Parks and Recreation began acquiring Marsh properties in the 1960s, and in 1993 started to implement extensive modifications to the Marsh area intended to address and resolve environmental concerns[4]. Modifications included adding and removing dikes, adding water-control gates and culverts, and re-contouring certain flow features. The added features were not maintained, and were subsequently abandoned.[5] The reasons for this abandonment have not been identified. As a result, silt-up and vegetation overgrowth has reduced the capacity and impeded the water flow in the Creek. Fish-kills within the Marsh have also increased; agribusiness has suffered; sport fishing has all but disappeared; and negative effects on endangered wildlife are being documented.[6]

Interviewees from local citizens' groups including the Pescadero Municipal Advisory Group (PMAC), the California Alliance for Species Enhancement (CASE), and the San Mateo County Farm Bureau have stated that State Parks' modifications have exacerbated the flooding. Scientists are mostly in agreement.[7] For many years, citizens' groups have advocated County and State

[7] Interview, scientist, California Dept. of Fish and Game.

action to provide relief from the flooding, and have proposed some immediate fixes. These included: dredging the streambed; raising the roadway at the bridge and especially at the low-point of the road; building a causeway and/or; installing a pump to move water from the upstream side of the bridge to a point downstream. None of these proposals have been implemented.

Permitting complexities can be additional barriers to immediate and broader County action. However, the Grand Jury is unaware that the County has actually applied for, or has been denied, any permits to address the road-flooding problem. The entities involved in permitting and advising permit issuance include State Parks, State Fish and Game, U.S. Fish and Wildlife Service, the Coastal Commission, and many others. (See, Attachment B: San Mateo County Public Works Permitting Flowchart.) A November 2010 letter from NOAA's National Marine Fisheries Service (NMFS) to California State Parks and Recreation and San Mateo County Public Works states that dredging may be a feasible solution to local road flooding, as well as alleviating the now encumbered fish passage (salmonids) until more extensive Marsh ecosystem recovery work is completed.[8] It also advises that dredging permits from the State (if necessary) should not be a hindrance and that NOAA stands ready to work with State Parks and the County on such an effort. (*See,* Attachment C: NOAA letter to California State Parks and San Mateo County Dept. of Public Works.)

The responsibility for Pescadero Creek Road and its maintenance belongs to San Mateo County Public Works. Public Works is also responsible for a 30-ft right-of-way on either side of the road. Silt re-deposition, vegetation overgrowth, and debris collection likely would require limited periodic clearing and clean-up efforts in future years. From interviews, the Grand Jury learned that action has not been taken in part because of other priorities, political and jurisdictional disputes with other levels of State and Federal government as well as potential permitting complexities.

County officials and advisors have discussed the concept of "Emergency" public works action with the Grand Jury.[9] The concept of "Emergency" action applies in two distinct circumstances. One is the declaration of a state of emergency by either a local government or the state, such as in 2010 when the San Bruno gas line exploded. The other involves conditions in which a local governmental entity, such as San Mateo County Public Works, can take emergency action to resolve an issue without the need to obtain prior permits to approve such actions. The permits in both circumstances may be resolved after the fact. Typically, Public Works has taken immediate action when necessary to repair roads/access due to slip-outs, rock-falls, flooding, under emergency authority, with permitting/remediation resolved after the fact.

California Government Code §21060.3 defines "Emergency" as a sudden, unexpected occurrence, involving a clear and imminent danger, demanding immediate action to prevent or mitigate loss of, or damage to, life, health, property, or essential public services. "Emergency"

---

[8] Attachment B, Letter, NOAA / Fisheries to Public Works, and State Parks, November 24, 2010.
[9] CEQA Cal Government Code §21060.3; Cal. Code of Regulations, §15269 (d).

includes such occurrences as fire, flood, earthquake or other soil or geologic movements, as well as such occurrences as riot, accident or sabotage.

The California Code of Regulations §15269 (Title 14, Ch. 3, Art. 18), Emergency Projects, exempts a series of emergency project types from the requirements of the California Environmental Quality Act (CEQA). Among them are:

> (c) Specific actions necessary to prevent or mitigate an emergency. This does not include long term actions undertaken for the purpose of preventing or mitigating a situation that has a low probability of occurrence in the short-term.

In addition to the California Government Code reference cited above, there are other emergency provisions for waiving permits, allowing immediate actions to address issues of protecting life and public property from imminent danger, including fill and dredging activities under emergency conditions. Applicable references include:

- California Coastal Act: Public Resources Code § 30611 Emergencies; waiver of permit
- Local Coastal Program: SMC Local Coastal Program 9.15 Emergency Provisions
- US Army Corps of Engineers Regional General Permit 5 (emergency defined according to CEQA)[10]
- California Dept. of Fish and Game Code §1610 (a)(b)[11]

Road flooding is one symptom of a deteriorating Marsh watershed. An integrated overall plan is necessary to identify engineering actions needed to address all the interactive elements of the Pescadero Marsh ecosystem. One initiative to develop an overall solution is now underway by the Resource Conservation District (RCD), chartered to advise the County on conservation and environmental issues. The RCD is a Special District of California and is appointed by and advisory to the San Mateo County Board of Supervisors. The RCD obtained funding in 2011 to conduct a study to explore lasting solutions for the Marsh watershed, including resolution of the road-flooding problem. The elapsed time for the RCD research study plus the resulting actual project work will take at least 5 years.

Investigation

To investigate Pescadero Creek flooding, the San Mateo Civil Grand Jury took site tours, reviewed documents and reports, and conducted interviews with Federal, State and County government personnel, and scientific and citizens' groups, including:

- San Mateo County Board of Supervisors
- San Mateo County Public Works
- San Mateo County Resource Conservation District (RCD)
- California State Fish and Game Department

- Pescadero Municipal Advisory Council (PMAC)

Note that the Grand Jury attempted to interview two individuals from California State Parks and Recreation, the agency that owns the Marsh and is responsible for its management. The individuals first agreed, then later declined through their lawyers, to provide informational interviews to the Grand Jury on the subject of this Report. After substantial delay, the State's lawyers subsequently claimed that State Park and Recreation has "…very little specific knowledge about the impacts, the causes, or the responsibility for the flooding" and therefore would not allow its clients to be interviewed (even when written questions were tendered in advance). The Grand Jury is disappointed in the lack of cooperation and surprised by the claimed ignorance on the part of the public agency directly responsible for managing the Marsh. For the record, the Grand Jury considers the issuance of this Report to be only part of an open and continuing investigation of matters relating to road flooding, Butano Creek, and the Pescadero Marsh. The Grand Jury expressly reserves its right to request that a subpoena issue from the Superior Court compelling the attendance of and/or production of records before the Grand Jury from any witness. The Grand Jury continues to evaluate whether such steps are required in this matter.

Reference documents reviewed included public records and reports, relevant websites, County engineering and scientific documents and reports, and documents provided by or referenced by the interviewees.

Site tours included several walk-arounds of Butano Creek (at and around the Bridge) and the Marsh and its tributary creeks, as well as the estuary exit sand-berm along the coast.

Findings

The Grand Jury finds:

1. The Butano Creek overflows its banks and floods Pescadero Creek Road and surrounding farmland each year during periods of rains.

2. The flooding of Pescadero Creek Road at Butano Creek Bridge creates a dangerous setting and, when impassable, delays public safety access and virtually isolates a Pescadero community of approximately 650 people.

3. Silt accumulation, vegetation overgrowth, and debris have reduced flow capacity of Butano Creek and increased road flooding risk.

4. Butano Creek has not been thoroughly cleared of accumulated silt, vegetation overgrowth, or debris for decades.

5. California State Parks and Recreation, beginning in 1993, made extensive modifications in the Marsh to re-establish a "natural ecological environment." Some modifications have not been maintained (e.g., flood gates) and, according to several interviewees, are presently ineffective and have made road-flooding conditions worse.

6. Solutions proposed to San Mateo County Public Works to correct the flooding include a raised roadway or a causeway, over-road pumping, dredging, and brush and debris clearance. The County has not adopted any of these suggestions.

7. San Mateo County is responsible for maintaining Pescadero Creek Road and its 30-foot right of way and therefore for correcting the road-flooding situation.

8. Multiple agencies, each with its own specific interests, might normally have to approve or advise on approval of permits to make changes that would resolve the flooding problem. Currently, any one agency could stop the process.

9. Multiple sections of California and federal law, e.g. California Fish and Game Code §1601, CEQA, CA Gov't Code §21060.3, and Cal. Code of Regs. §15269(d), provide for emergency exceptions to the permitting restrictions that normally apply to stream bed changes and road repairs. These may be available to Public Works to expedite actions that would eliminate Pescadero Road flooding.

10. The Grand Jury is unaware that the County has ever applied for, or been denied, any permit(s) for actions that would address the road flooding.

11. A November 24, 2010 letter from the NOAA's National Marine Fisheries Service (NMFS) North Central Coast Office to California State Parks and San Mateo County Public Works expressed the view that the permits required to address the road flooding should not be a hindrance and that "NMFS stands ready to work with State Parks and the County toward the shared goal of resource protections while improving the safety of Pescadero Road."

12. The Resource Conservation District has funding to explore solutions to environmental quality issues in the Pescadero Marsh ecosystem and intends to address Pescadero Creek Road flooding as part of its efforts. Its time frame, however, does not address the immediate need.

Conclusions

The Grand Jury concludes:

1. The status quo of annual road flooding is unsafe and unacceptable. The annual flooding of the main road serving Pescadero seriously jeopardizes citizens' safety, and impedes commercial activity in the area.

2. The diminishing capacity of the Butano Creek due to accumulated silt, vegetation

overgrowth, and debris increases the risk of flooding with lesser rainfall. This annual flooding is predictable and correctable.

3. The Board of Supervisors and responsible County government entities are essentially nonresponsive, hampered by other priorities, jurisdictional disputes with various State and Federal agencies, permitting requirements, and insufficient political will to overcome these.

4. The difficulty of obtaining approval of permits to address road flooding cannot be substantiated because, to the Grand Jury's knowledge, none have ever been applied for, or denied.

5. The Grand Jury believes that the County could invoke the "emergency repair" concept, take remedial action, and immediately end the Pescadero Creek Road flooding.

6. The estimated five years timing for any flood-control relief resulting from RCD's efforts is unacceptable.

7. Immediate solutions to road flooding must be implemented. The most promising include removal of excess silt and clearance of vegetation overgrowth and debris from as much of the Butano Creek as necessary to eliminate the annual road flooding.

Recommendations

The Grand Jury recommends that the Board of Supervisors:

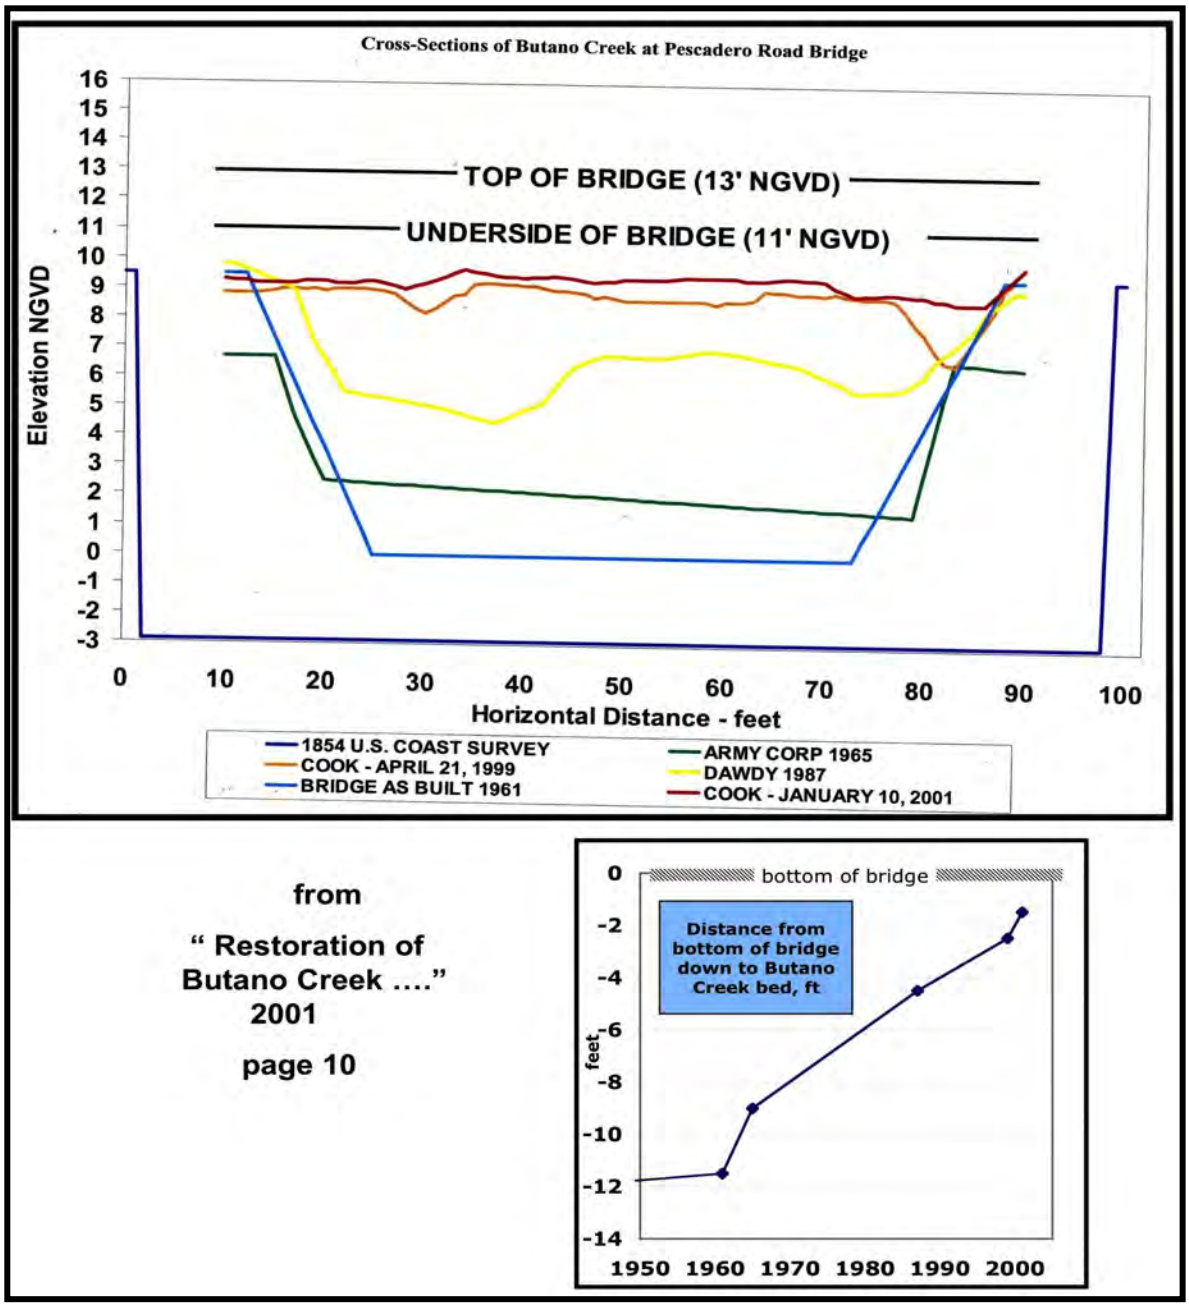
1. Immediately direct the County Department of Public Works to remove excess silt and clear vegetation overgrowth and debris from as much of the Butano Creek as necessary to eliminate the road flooding. The work should be completed as soon as possible, and in all circumstances before October 1, 2012, the start of the 2012-13 rainy season. The intended result of this work is to prevent flooding of Butano Creek onto and around Pescadero Creek Road and farmlands.

2. Review the NOAA (NMFS) Nov 24, 2010 letter (*See,* Attachment B), and consult with NOAA and the San Mateo County RCD on strategies for expediting permit approvals, if any are required, to accomplish the work described in Recommendation 1.

3. If needed to accomplish Recommendation Number 1, use San Mateo County's authority under the various emergency provisions of California and/or federal law to take actions mitigating flooding to protect life or property.

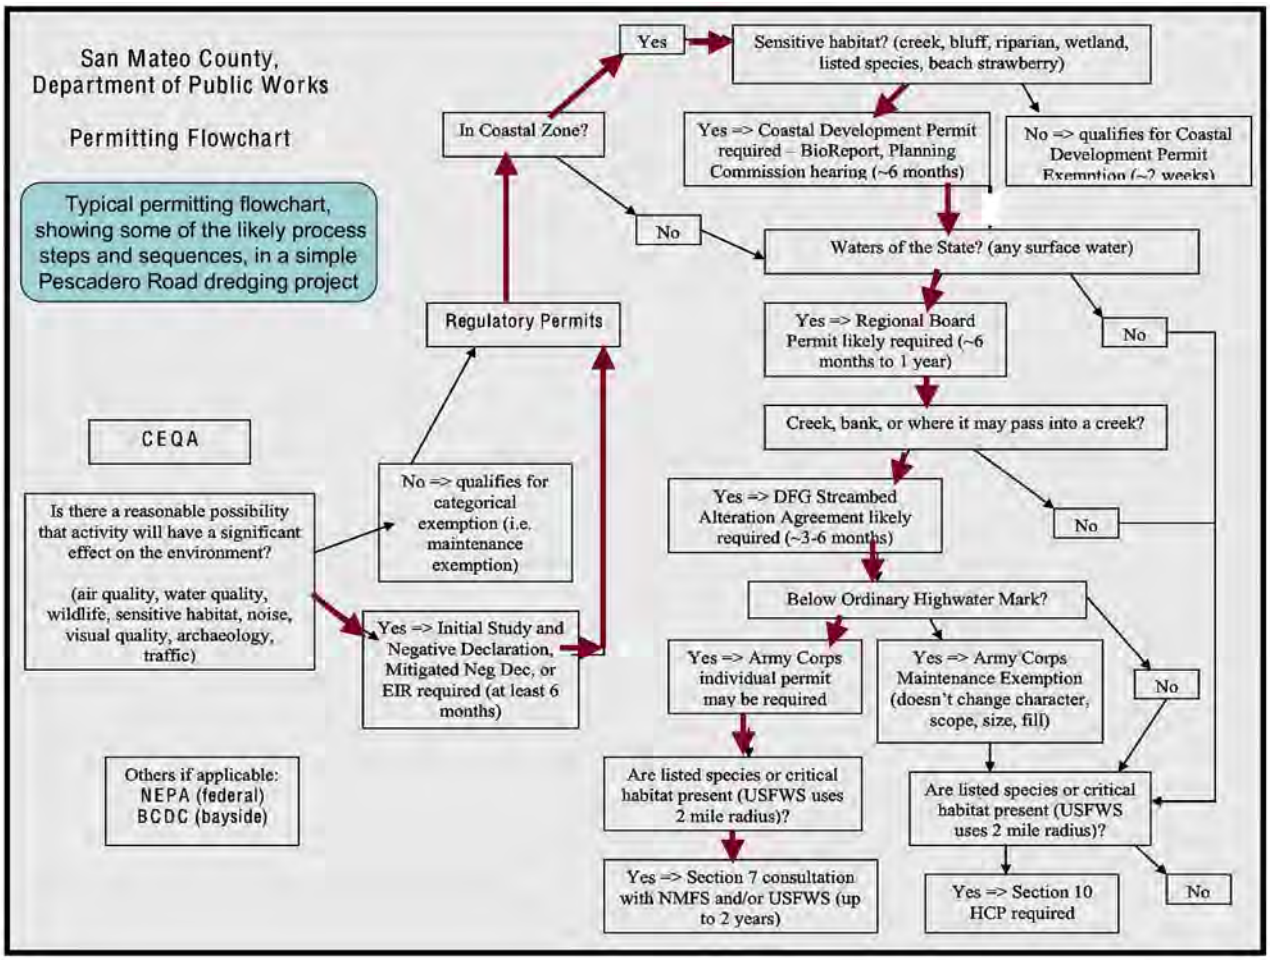
4. Direct the San Mateo County Department of Public Works to periodically clean new silt, vegetation overgrowth, and debris from Butano Creek as needed to maintain flows and eliminate the recurrence of Pescadero Creek Road flooding.

Attachment A: Silt-up Profiles of Butano Creek Bridge



This image shows the profile of the Butano Creek streambed below the Pescadero Creek Road Bridge. Early surveys show the streambed some 12 feet below the bottom of the bridge. Today, the bridge clears the silted and debris-filled creek bottom by only 2 feet.

Attachment B:
San Mateo County Public Works Permitting Flowchart



This flowchart, prepared by the San Mateo County Department of Public Works, illustrates the path and sequence for obtaining permit approval for relatively straightforward projects. It does not show the additional entities that, as a matter of course, provide technical input and guidance to the indicated permitters.

Joe LoCoco, Deputy Director, Road Service
County of San Mateo Department of Public Works
752 Chestnut Street
Redwood City, California 94063

Dear Mr. LoCoco and Ms. Kerbavaz:

This letter is in response to the existing channel conditions in Butano Creek beneath and adjacent to the Pescadero Road bridge, near the town of Pescadero, San Mateo County, California. NOAA's National Marine Fisheries Service (NMFS) is concerned existing channel conditions may be affecting federally listed salmonids and their habitat. The County of San Mateo Department of Public Works (County) is responsible for maintenance activities at the Pescadero Road bridge. Butano Creek flows into the Pescadero Marsh Natural Preserve which is owned and managed by the California Department of Parks and Recreation (State Parks).

When the bridge was constructed in 1961, the channel underneath the bridge was approximately 11 feet deep and 80 feet wide. Over the years, approximately 9 feet of silt has built up in the channel, reducing the vertical clearance underneath the bridge to about 2 feet. This has resulted in an increase in the frequency of flooding and may be impairing fish passage.

During large storm events, Butano Creek cannot be contained within its banks at the bridge and floodwaters spill onto Pescadero Creek Road and adjoining properties. Under existing conditions, maintenance activities at the bridge that do not include work within the actual creek channel are unlikely to alleviate flood concerns and may continue to impede passage for listed salmonids. We believe there are possible near-term and long-term solutions that would minimize flooding along Pescadero Creek Road, allow for some level of maintenance, and improve fish passage. Dredging, for example, may have only short-term benefits to flooding and fish passage, but could be an interim plan until a long-term solution is reached. We urge the County to coordinate with State Parks, NMFS, and other appropriate stakeholders to investigate both short and long-term solutions for flooding issues with the assurance of fish passage.

It is our understanding, opportunities for the County to conduct these activities may be limited for a variety of reasons, including access onto State Parks property. Although State Parks is not a flood control agency, this should not preclude the agencies working collaboratively on how to address resource protection while improving the safety of Pescadero Road.

We acknowledge permits will be required but do not see this as a hindrance to a solution. Fish passage improvement and channel maintenance activities are the types of projects which are regularly permitted by the appropriate agencies and NMFS routinely consults with Federal action agencies pursuant to the Federal Endangered Species Act. NMFS stands ready to work with State Parks and the County towards the shared goal of resource protection while improving the safety of Pescadero Road.

If you have questions or concerns regarding this letter please feel free to contact Mr. William Stevens of my staff at (707) 575-6066 or via email at William.Stevens@noaa.gov.

Sincerely,

Dick Butler
North Central Coast Office Supervisor
Protected Resources Division

Rich Gordon, San Mateo County Board of Supervisors, Redwood City

This letter from Mr. Butler of NOAA/Marine Fisheries, dated November 24, 2010, summarizes the silt-up of the Butano Creek streambed and its association with the annual Pescadero Road flooding. It acknowledges the potential interim benefits of dredging. It urges the County to coordinate with stakeholders to investigate solutions and provides guidance and offers support in overcoming permitting issues. (*highlights supplied*).

COUNTY OF SAN MATEO
Inter-Departmental Correspondence
County Manager

Date: July 3, 2012
Board Meeting Date: July 24, 2012
Special Notice / Hearing: None
Vote Required: Majority

To: Honorable Board of Supervisors

From: John L. Maltbie

Subject: 2011-12 Grand Jury Response

RECOMMENDATION:
Approve the Board of Supervisors' response to the 2011-12 Grand Jury report titled: The Annual Flooding of Pescadero Creek Road.

BACKGROUND:
On March 1, 2012, the Grand Jury filed a report titled: The Annual Flooding of Pescadero Creek Road. A copy of the Grand Jury report is attached hereto and identified herein as Exhibit A. The Board of Supervisors is required to submit comments on the findings and recommendations pertaining to the matters under control of the County of San Mateo within ninety days. The County's response to the report is due to the Hon. Gerald J. Buchwald no later than July 30, 2012.

Acceptance of this report contributes to the Shared Vision 2025 outcome of a Collaborative Community by ensuring that all Grand Jury findings and recommendations are thoroughly reviewed by the appropriate County departments and that, when appropriate, process improvements are made to improve the quality and efficiency of services provided to the public and other agencies.

DISCUSSION:
The Annual Flooding of Pescadero Creek Road

Findings:

Grand Jury Finding Number 1. The Butano Creek overflows its banks and floods Pescadero Creek Road and surrounding farmland each year during periods of rains.

Response: Agree. Butano Creek (Creek) overflows its banks and floods Pescadero Creek Road in most years.

Grand Jury Finding Number 2. The flooding of Pescadero Creek Road at Butano Creek Bridge creates a dangerous setting and, when impassable, delays public safety access and virtually isolates a Pescadero community of approximately 650 people.

Response: Disagree in part. Depending on the severity of flooding, access to the community can be impacted. However, the community of Pescadero does not become isolated, as there are two additional, though more circuitous routes into and out of Pescadero that can be taken when Pescadero Creek Road is impacted. These routes include Stage Road, which provides access from the north, and Pescadero Creek Road which provides access from the east. In addition, prior to expected flood events, the County Fire engine at Pescadero moves from the station on the west side of the bridge to the east side, closer to town. Fire response and emergency response are therefore available to the community during flooding events.

Grand Jury Finding Number 3. Silt accumulation, vegetation overgrowth, and debris have reduced flow capacity of Butano Creek and increased road flooding risk.

Response: Disagree in part. It is not clear to what the "debris" reference refers to. Among other contributory flooding factors, silt accumulation and vegetation overgrowth within and adjacent to the Creek, have contributed to flow capacity restrictions within the channel. However, because the area downstream of the bridge and extending as far as the ocean is relatively flat, sediment will naturally accumulate along this section of Creek as long as a sediment source, such as the naturally occurring sandstone formations in the upper watershed, exists.

It is ultimately not clear to what extent these may be naturally occurring processes and to what extent they "have increased road flooding risk." It is also not clear whether downstream restoration efforts or modifications to the Creek system have contributed to any issues associated with flooding..

Grand Jury Finding Number 4. Butano Creek has not been thoroughly cleared of accumulated silt, vegetation overgrowth, or debris for decades.

Response: Disagree in part. The Creek is lengthy and the Finding is not specific to a specific section of Creek. The County performed silt removal work within the Creek and Pescadero Creek Road right-of-way during the 1980's and early 1990's. Additionally, we understand that members of the Pescadero community removed woody debris, including beaver dams, in early 2000's. The County of San Mateo has a limited road right of way along Pescadero Creek Road at the Creek, which is 100 feet wide, and is offset 40 feet approximately 40 feet at the middle of the bridge. With the right of way offset, the County actually has only approximately 60 feet of right of way that is uniformly under our control. Accounting for the width of the bridge (approx. 24 feet), we have full control of approximately 18 feet of channel on either side of the bridge. Silt removal performed by the County is generally limited to the section of Creek within the County's right of way.

Grand Jury Finding Number 5. California State Parks and Recreation, beginning in 1993, made extensive modifications in the Marsh to re-establish a "natural ecological environment." Some modifications have not been maintained (e.g., flood gates) and, according to several interviewees, are presently ineffective and have made road-flooding conditions worse.

Response: Disagree in part. California State Parks and Recreation has performed work within the Marsh. This includes installation of tidegates which we understand are not presently functioning. The specific interaction and effect of the Marsh on the Creek and flooding is not conclusive. Additionally, it has not been determined whether or not the tide gates have a direct effect on the flooding of Pescadero Creek Road.

Grand Jury Finding Number 6. Solutions proposed to San Mateo County Public Works to correct the flooding include a raised roadway or a causeway, over-road pumping, dredging, and brush and debris clearance. The County has not adopted any of these suggestions.

Response: Disagree in part. These have been "suggested solutions" communicated by the community. However, it has not been determined whether any of these "suggested solutions" would in fact eliminate the flooding of Pescadero Creek Road. A significant section of Pescadero Creek Road within the vicinity of the Creek is designated on the Federal Emergency Management Agency (FEMA) Flood Insurance Rate Maps as being subject to flooding. Flooding within the areas designated on the FEMA maps will always be a possibility.

Grand Jury Finding Number 7. San Mateo County is responsible for maintaining Pescadero Creek Road and its 30-foot right of way and therefore for correcting the road-flooding situation.

Response: Disagree. The County of San Mateo is responsible for maintaining constructed road infrastructure within the limits of its road right-of-way. The road right-of-way for Pescadero Creek Road is 100 feet wide at the bridge over the Creek and is offset by forty feet (40') creating right of way limits that vary on each side of the bridge and Creek. The County of San Mateo does not have responsibility for areas outside of its road right of way (upstream or downstream of the bridge over the Creek), nor does it have responsibility for private property drainage. This Finding infers that the County has the responsibility to clear sediment or debris from the Creek upstream and downstream of the bridge to ensure that Pescadero Creek Road will not flood, which is not the case.

Grand Jury Finding Number 8. Multiple agencies, each with its own specific interests, might normally have to approve or advise on approval of permits to make changes that would resolve the flooding problem. Currently, any one agency could stop the process.

Response: Agree. The flooding that occurs on Pescadero Creek Road is a complex, multi-agency, and jurisdictional issue, which may potentially involve State and Federal agencies, the County, and private land owners. Not only are downstream solutions to be evaluated, but upstream property owners and land use must also be considered because the upstream properties are the source of sediment.

Grand Jury Finding Number 9. Multiple sections of California and federal law, e.g. California Fish and Game Code §1601, CEQA, CA Gov't Code §21060.3, and Cal. Code of Regs. §15269(d), provide for emergency exceptions to the permitting restrictions that normally apply to stream bed changes and road repairs. These may be available to Public Works to expedite actions that would eliminate Pescadero Road flooding.

Response: Disagree in part. There are in fact emergency exemptions which allow for after the fact permitting and would allow for expedited work. However, these exemptions generally pertain to situations where there is an immediate threat to public safety as a result of extreme natural events. On-going drainage issues within a designated area of flooding are generally not considered to be eligible for emergency permitting exemptions and would not be applicable to the flooding of Pescadero Creek Road.

Grand Jury Finding Number 10. The Grand Jury is unaware that the County has ever applied for, or been denied, any permit(s) for actions that would address the road flooding.

Response: Disagree. While a solution to the flooding issue has not been determined, the County of San Mateo has in the past applied for permits that would improve or restore localized drainage. Within the past year, the County received a permit to clear a culvert (pipe) along the south side of Pescadero Creek Road that flows to the south side of the bridge over the Creek. In addition, the County currently has a permit application pending for restoring the culvert capacity leading to the north side of the bridge.

Grand Jury Finding Number 11. A November 24, 2010 letter from the NOAA's National Marine Fisheries Service (NMFS) North Central Coast Office to California State Parks and San Mateo County Public Works expressed the view that the permits required to address the road flooding should not be a hindrance and that "NMFS stands ready to work with State Parks and the County toward the shared goal of resource protections while improving the safety of Pescadero Road."

Response: Disagree in part. NMFS is one regulatory agency among several that would be required to approve work in the Creek. NMFS regulates impacts to marine and anadromous wildlife, such as steelhead and Coho. Other agencies that would need to permit sediment removal from the Creek include: California Dept. of Fish and Game (regulates streambed alteration and species protection), California Regional Water Quality Control Board (regulates impacts to "Waters of the State" under Section 401 of the Clean Water Act), U.S. Army Corps of Engineers (regulates dredge and fill work

under Section 404 of the Clean Water Act and Section 10 of the Rivers and Harbors Act), and U.S. Fish and Wildlife Service (regulates terrestrial and freshwater species protection such as California red-legged frog and San Francisco garter snake). All agencies have agreed to work with the County and State Parks towards expediting permits once a project has been proposed. However, this does not mean that the regulatory agencies would allow the County or State Parks to do whatever is necessary to dredge the Creek. Any dredging of the Creek beyond the County road right-of-way would have potentially high impacts to existing dense riparian and wetland habitats, water quality, and endangered species. Any proposed dredging would require working closely with regulatory agencies to develop a plan to minimize those impacts to the maximum extent possible and mitigation for any impacts would likely be required.

Grand Jury Finding Number 12. The Resource Conservation District has funding to explore solutions to environmental quality issues in the Pescadero Marsh ecosystem and intends to address Pescadero Creek Road flooding as part of its efforts. Its time frame, however, does not address the immediate need.

Response: Disagree. The San Mateo County Resource Conservation District (SMCRCD) does not have funding to explore solutions to environmental quality issues in the Pescadero Marsh ecosystem. The SMCRCD provided the Pescadero Municipal Advisory Council, at their April 10, 2012 meeting, with a written description of the SMCRCD work as funded by a $75,000 grant from the Bay Area Integrated Regional Water Management Plan through Proposition 84. The following includes excerpts from the written description as shown below in quotation marks.

“This project is to do the required analysis (most likely hydrology, hydraulics, refined sediment budget - not anything that has already been done but in some cases refining what has been done to a resolution required for permits) and develop consensus around an option or suite of options so that it is permit-ready and implementation-ready.”

“What it can do: Develop conceptual designs that are broadly supported by community members, landowners, and resource agencies, do the preliminary work for permit-readiness, include climate change considerations.”

“What it will not do: address flooding from mainstem Pescadero, complete designs, complete permits, construct solutions, presuppose a solution before the analysis has been completed.”

Recommendations:

1. Immediately direct the County Department of Public Works to remove excess silt and clear vegetation overgrowth and debris from as much of the Butano Creek as necessary to eliminate the road flooding. The work should be completed as soon as possible, and in all circumstances before October 1, 2012, the start of the 2012-13 rainy season. The

intended result of this work is to prevent flooding of Butano Creek onto and around Pescadero Creek Road and farmlands.

Response:
This recommendation requires further analysis, as it has not been determined how dredging would affect riparian and wetland habitat, sensitive species, or adjacent properties. Furthermore, the County of San Mateo has no authority to enter onto private property to perform work of any kind absent a mutual agreement to do so with landowners, and we do not believe that dredging within the 100 feet of County right of way will relieve flooding.

It has also not been determined that dredging is the optimal solution to preventing flooding of Pescadero Creek Road from the Creek. While dredging the Creek has been suggested, there has been no analysis of the impacts of dredging on surrounding lands. It has been reported that the Creek does not have a defined channel approximately 1,000 feet downstream of the Pescadero Creek Road Bridge. Thus, it is not clear whether it is possible to dredge "as much of the Butano Creek as necessary to eliminate the road flooding." The fact that the area is in a defined flood plain suggests that dredging of the creek to eliminate flooding is not in fact achievable. We also do not believe an October 1, 2012 timeframe is plausible for any work involving the Creek. Our experience has been that permit approvals can be expected to take more than one year to obtain in instances such as these where many permit approvals are required to assure that the water quality, sensitive habitats, and protected species are not adversely impacted.

As mentioned above in the Response to Finding 12, the SMCRCD is currently working on a grant funded project which would provide additional site analysis. It is believed that such an analysis will help establish potential solutions to the localized flooding. The County has been in contact with the SMCRCD regarding the possibility of supporting an expanded study by the SMCRCD that would include an analysis of the impacts associated with Creek dredging efforts.

In addition, County staff are working on ways to reduce the danger to the community during flooding by posting electronic message signs on either side of the flood prone area near the bridge. This will not solve the long term flooding problem, but will clearly inform the drivers that the bridge is flooded and hopefully reduce the danger to drivers in the near term. (Are these the measures being considered?)

2. Review the NOAA (NMFS) Nov 24, 2010 letter (See, Attachment B), and consult with NOAA and the San Mateo County RCD on strategies for expediting permit approvals, if any are required, to accomplish the work described in Recommendation 1.

Response:
This recommendation requires further analysis; however, the County has been in contact with NMFS, the SMCRCD, other pertinent regulatory agencies, and State representatives regarding the issues surrounding the Creek, Pescadero Creek Road,

and the Marsh. As stated in the Response to Finding 11, multiple permits or approvals would be required to perform dredging or any work in or near the Creek. The additional site analysis which is to be performed by the SMCRCD through the grant funding is generally considered the next key step in identifying potential flood mitigation solutions. To the extent that the SMCRCD study could be expanded to include levels of detail that would allow for a complete site analysis, the County intends to prepare a comprehensive report during FY 2012/13 which can be utilized as a baseline for the development of solutions to reduce the flooding of Pescadero Creek Road from the Creek. Through discussions with the various permitting agencies, there has been general agreement among the agencies to expedite their reviews.

3. If needed to accomplish Recommendation Number 1, use San Mateo County's authority under the various emergency provisions of California and/or federal law to take actions mitigating flooding to protect life or property.

Response:
This recommendation will not be implemented because it is not feasible. The County's Department of Public Works, works closely with regulatory agencies on numerous projects every year and has had discussions with the various agencies with respect to this and other projects. We have confirmed at several levels that work within the Creek channel would not be considered by the regulatory agencies as emergency work and would therefore require standard reviews and permit approvals. We are, however, continuing to investigate whether there may be FEMA funding opportunities through CalEMA and whether these programs offer opportunities for expedited work approvals.

4. Direct the San Mateo County Department of Public Works to periodically clean new silt, vegetation overgrowth, and debris from Butano Creek as needed to maintain flows and eliminate the recurrence of Pescadero Creek Road flooding.

Response:
This recommendation requires further analysis. As noted in the Response to Recommendation 1, it has not been determined that dredging the Creek is a feasible short term or long term solution to flooding. The County currently has plans to perform an engineering analysis that would consider the effectiveness of potential alternatives, including dredging within the Pescadero Creek Road right-of-way and beyond. We are planning on prioritizing such studies and anticipate that they will be completed within the next fiscal year. Regular and periodic removal of silt, vegetation, and debris from the Creek would require permits from the regulatory agencies.

FISCAL IMPACT:
There is no Net County Cost associated with accepting this report.

TABLE OF CONTENTS

BASIS OF ESTIMATE

PROJECT DESCRIPTION

The project consists of Two Options:

Option A (New Site): Project consists of a new two-story 8,104 SF fire station with living quarters and apparatus bays. Sitework includes vehicular and pedestrian paving, landscaping, site lighting and drainage, new emergency generator and fuel storage tanks. Utilities include incoming water, storm drain and electrical service. Sewer is provide by an onsite septic system, gas is provided by propane tanks.

Option B (Existing Site): Project consists of replacing existing living quarters building with a new two-story 5,508 SF living quarters building, complete interior/exterior renovation to the existing 2,400 SF apparatus building, a new 1,100 SF addition to the existing apparatus building. Sitework includes vehicular and pedestrian paving, landscaping, site lighting and drainage, replacement of existing emergency generator and fuel storage tanks. Utilities include septic system replacement, distribution of utilities to buildings.

REFERENCE DOCUMENTATION

Documents provided by Ratcliff Architects and their Design Team.

SITE VISIT

Meeting and site visit November 20, 2013.

BASIS FOR PRICING

This estimate reflects the fair construction value for this project and should not be construed as a prediction of low bid. Prices are based on local prevailing wage construction costs at the time the estimate was prepared. Pricing assumes a procurement process with competitive bidding for all sub-trades of the construction work, which is to mean a minimum of 3 bids for all subcontractors and materials/equipment suppliers. If fewer bids are solicited or received, prices can be expected to be higher.

Subcontractor's markups have been included in each line item unit price. Markups cover the cost of field overhead, home office overhead and subcontractor’s profit. Subcontractor's markups typically range from 15% to 25% of the unit price depending on market conditions.

General Contractor’s/Construction Manager's Site Requirement costs are calculated on a percentage basis. General Contractor’s/Construction Manager's Jobsite Management costs are also calculated on a percentage basis.

General Contractor’s/Construction Manager's overhead and fees are based on a percentage of the total direct costs plus general conditions, and covers the contractor’s bond, insurance, site office overheads and profit.

Unless identified otherwise, the cost of such items as overtime, shift premiums and construction phasing are not included in the line item unit price.

BASIS OF ESTIMATE

This cost estimate is based on standard industry practice, professional experience and knowledge of the local construction market costs. TBD Consultants have no control over the material and labor costs, contractors methods of establishing prices or the market and bidding conditions at the time of bid. Therefore TBD Consultants do not guarantee that the bids received will not vary from this cost estimate.

CONTINGENCY

Design Contingency ***15%***

The Design Contingency is carried to cover scope that lacks definition and scope that is *anticipated* to be added to the Design. As the Design becomes more complete the Design Contingency will reduce.

Construction Contingency ***0%*** ***to be carried elsewhere in Owner's Budget***

The Construction Contingency is carried to cover the unforeseen during construction execution and Risks that do not currently have mitigation plans. As Risks are mitigated, Construction Contingency can be reduce, but should not be eliminated.

ESCALATION

Escalation has been included based on a January 2015 start of construction.

EXCLUSIONS

- Land acquisition, feasibility, and financing costs
- All Owner soft costs
- All professional fees and insurance
- Construction Manager or Agency Costs
- Site or existing condition survey investigation costs, including determination of subsoil conditions
- Hazardous materials inspection costs, or accommodations in construction for hazardous materials.
- Owners Construction Contingency for scope changes and market conditions at time of bid
- Permits

ITEMS THAT MAY AFFECT THIS ESTIMATE

Such items include, but are not limited to the following:

Modifications to the scope of work subsequent to the preparation of this estimate
Unforeseen existing conditions
Compression of planned construction schedule
Special requirements for site access or off-hours work
Restrictive technical specifications, excessive contract or non-competitive bid conditions
Sole source specifications for materials, products or equipment
Bid approvals delayed beyond the anticipated project schedule

8.2 Structural report

I. Structural Assessment of Existing Site

Introduction

This report presents the findings of building structural assessments per *ASCE 41: Seismic Rehabilitation of Existing Buildings.* Aspects of building performance that are considered include structural, nonstructural, and foundation/geologic hazard issues. Lifelines such as water, electrical, gas and waste, etc., beyond the perimeter of the building are not considered.

The ASCE 41 process has 3 tiers or levels of evaluation. A Tier 1 evaluation is considered a preliminary phase with the purpose of screening out buildings that are compliant and quickly identifying buildings with potential seismic deficiencies. A Tier 2 evaluation is an analysis of the building that addresses the potential seismic deficiencies identified in Tier 1 screening. A Tier 3 evaluation is a detailed and complete analysis of the building. For this evaluation, a Tier 1 screening was performed.

The structural elements including foundations and the nonstructural elements are evaluated with a choice of three main performance objectives: Collapse Prevention, Life-safety or Immediate Occupancy. In evaluating the fire station site, the life-safety and immediate occupancy damage states were considered. However because the fire station is an emergency facility the ultimate performance objective should be immediate occupancy.

Life-safe structural performance is the post-earthquake damage state in which significant damage to the structure has occurred, but some margin against the onset of partial or total collapse remains. Some structural elements and components are severely damaged, but this does not result in large falling debris hazards, either within or outside the building. Injuries may occur during the earthquake; however overall risk of life-threatening injury as a result of structural damage is expected to be low. It should be possible to repair the structure; however, for economic reasons this may not be practical. While the damaged structure is not an imminent collapse risk, it would be prudent to implement structural repairs or install temporary bracing prior to re-occupancy. Immediate Occupancy structural performance is the post-earthquake damage state to both structural and non-structural components such that damage is not life-threatening so as to permit immediate occupancy of the building after a design earthquake. Damage is repairable while the building is occupied.

The scope of work for the structural building assessments included the following tasks:

1. Reviewing available original construction documents.
2. Making a site visit to confirm that the available drawings properly identify the extent of the building, to observe whether significant building modifications have occurred, and to observe the nonstructural systems bracing and anchorage.
3. Performing the required calculations as required by ASCE 31.
4. Preparing a report summarizing our findings.

Barracks Building

The Barracks building is a single-story, light wood framed structure. The structural system matches that of a single family dwelling. The foundation consists of raised wood floor construction with a continuous concrete perimeter footing and isolated interior concrete piers. The floor and roof framing consist of short spanning, wood members not spaced more than 24 inches apart. The exterior walls and roof have plywood sheathing, while interior walls are sheathed with plaster or gypsum board. Multiple undocumented additions and modifications were observed. In general the additions and modifications consisted of wood construction similar to original construction type.

ASCE 41-13 Seismic Rehabilitation of Existing Buildings describes this structure as Building Type W1. In general this type of structure is ductile and tends to perform well in seismic events.

An ASCE 41-13 Life Safety basic checklist evaluation identifies the structure as being predominately compliant. The main exceptions were unknown factors of liquefaction and surface fault rupture which need to be review by a Geotechnical engineer. In addition the structural load path needs to be confirmed since the original documents do not clearly state how various concealed connections are constructed.

The Barracks building is part of an emergency response facility. Therefore an Immediate Occupancy performance level is required. An ASCE 41-13 Immediate Occupancy checklist evaluation for W1 structures identified a number of noncompliant items. These items must be addressed during a retrofit to comply with CBC requirements for Emergency Faculties. Some of these issues are no Hold-down anchors at shear walls, discontinuous chords and collectors, excessive unblocked diaphragms ratios if only exterior walls are considered part of the lateral resisting elements, interior shear walls with no footings or plywood sheathing if interior walls are considered part of the lateral system, as well as the items identified in the Life Safety check list. These identified issues are all minor in nature and could be retrofitted without significant cost.

The major compliance issue with achieving an Immediate Occupancy building performance level is the structure being located in an area subject to flooding. The structure has been subject to flood waters three times in recent years. In one of those events the structure experienced flood water levels three feet above the finished floor line of the building. Flooding will damage the structure and will render the building inoperable during the period of the flood, which would make an Immediate Occupancy performance level difficult to achieve even after a structural retrofit.

Apparatus Building

The original, main portion of the Apparatus building is a single-story, pre-engineered and pre-fabricated steel building. The structure consists of rigid steel frames in the transverse direction and rod bracing in the longitudinal direction on one side of the structure. There is no lateral system in the longitudinal direction where the large equipment doors are located. The foundation is a concrete slab-on-grade system with spread footings around the perimeter and under the steel frame locations. The walls are constructed with wood studs attached to steel frames and horizontal girts. The roof framing consists of steel joists with lightweight metal roofing. The diaphragm consists of rod bracing in alignment with the vertical rod bracing lateral system locations. An addition and modifications were observed during the site visit. In general the addition and modifications consist of wood construction and are not similar to the pre-manufactured steel building they are connected too.

ASCE 41-13 describes this steel building portion of the structure as Building Type S3. In general this type of system is designed for maximum efficiency of material and cost and not for a high performance during seismic events.

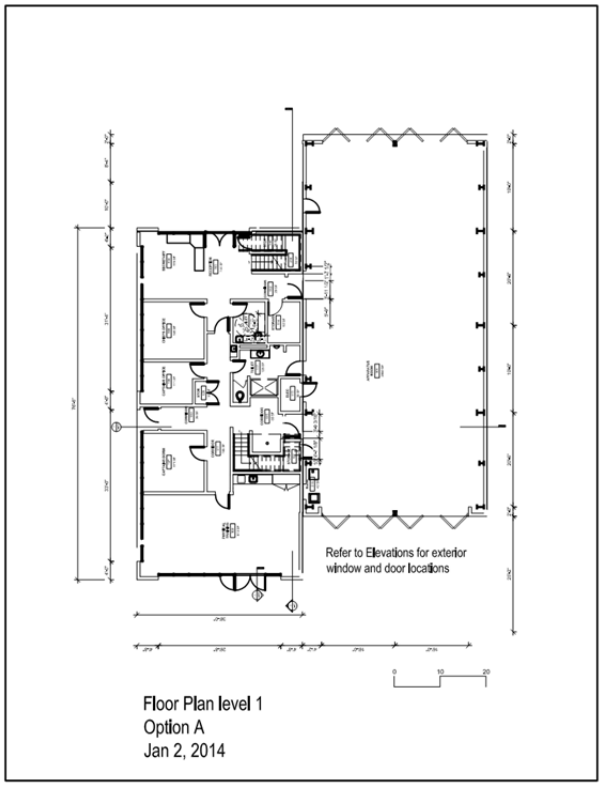
An ASCE 41-13 Life Safety basic checklist evaluation identifies the structure as being predominately noncompliant or unknown. Some of these identified issues are a mezzanine structure not being independently braced from the main building, load path issues related to the various additions, and no confirmation that the original, economically designed steel system has the additional capacity to resist the added demands from the various additions. The unknown factors of liquefaction and surface fault rupture also exist and need to be review by a Geotechnical engineer.

The Apparatus building is part of an emergency response facility. Therefore an Immediate Occupancy performance level is required. An ASCE 41-13 Immediate Occupancy checklist evaluation for S3 structures identified a number of noncompliant items which would need to be addressed during a retrofit to comply with CBC requirements for Emergency Faculties. Most of these noncompliant issues relate to the steel frame ductility checks. Since this type of steel system is typically designed for economy and not performance it would be anticipated that the identified issues would be major in nature and could be a challenge to retrofit without significant cost. The items identified in the Life Safety check list would also need to be addressed by the retrofit.

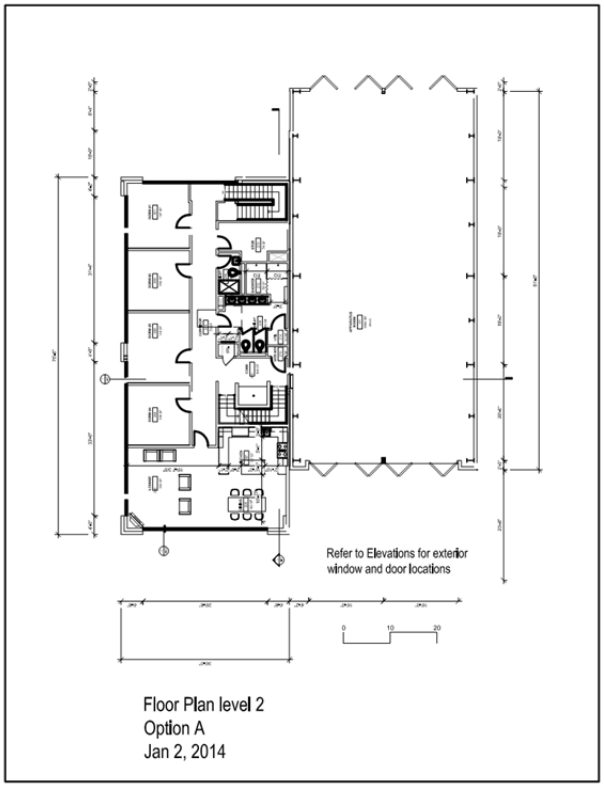
Two additional compliance issues required to achieve an Immediate Occupancy building performance level are the structure being located in an area subject to flooding and being located adjacent to a slope. In recent years the property has flooded numerous times. Although this structure has not been flooded, access into and out of the emergency facility during a flood event was impeded and would need to be evaluated and addressed. Due to the building being located within close proximity to an adjacent slope a Geotechnical engineer must evaluate the risk of slope failure and rock falls.

II. Option A: New Fire Station, Idealized Site

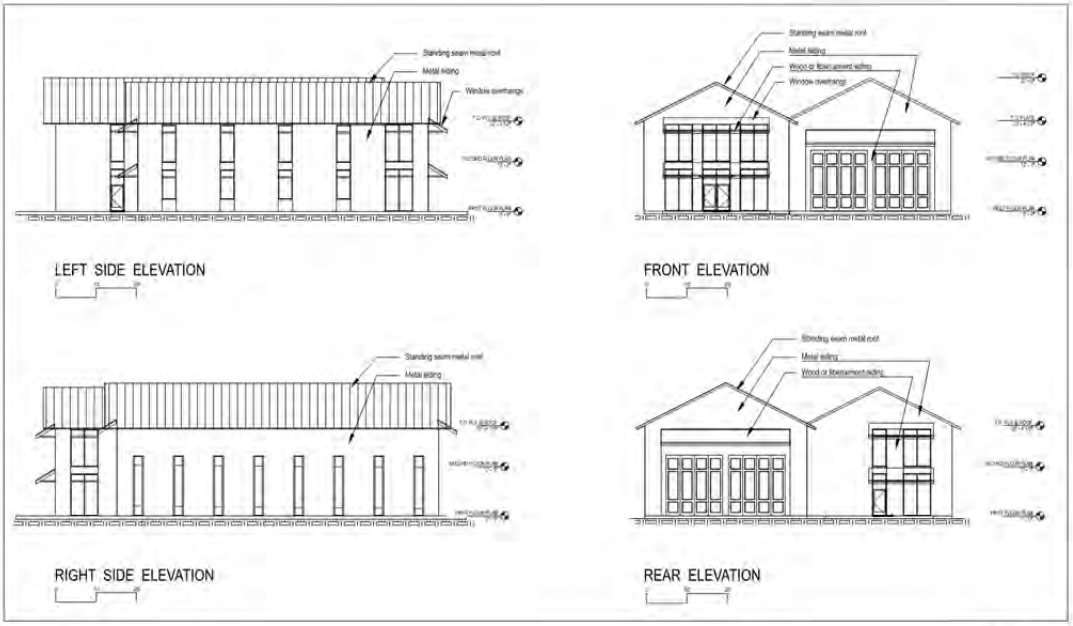
The structural system narrative is based on the concept architectural plans for a new apparatus building adjacent to an office and living quarters building as shown below. The two structures will be separate by a seismic joint.



Floor Plan level 1
Option A
Jan 2, 2014



Floor Plan level 2
Option A
Jan 2, 2014



Option A
Jan 2, 2014

The structural gravity system for the apparatus structure consists of steel beams in the transverse direction and along the perimeter supported on steel columns. Light gauge or wood roof framing members span between the steel beams to form the roof system. Exterior cladding is composed of either light gauge steel studs or wood studs spanning from the foundation to the roof framing level. The lateral system consists of steel moment frames in the transverse direction and plywood shear walls in the longitudinal direction. Reinforced masonry shear walls is an option to the plywood walls in the longitudinal direction. A plywood roof diaphragm is used to transfer seismic forces to the lateral system.

The structural gravity system for the Office/Living Quarters structure consists of light gauge or wood joists at the roof and floor levels. The joists at both levels are supported by light gauge or wood stud interior and exterior bearing walls. Roof joists span the transverse direction and are supported on interior corridor walls as required. The direction of floor joists framing is dependent on the Level One wall layout. As an alternate to roof and floor joists, trusses can be utilized at both levels. The lateral system in both transverse and longitudinal directions consists of plywood shear walls. Plywood roof and floor diaphragms are used to transfer seismic forces to the lateral system. For both gravity and lateral systems to be implemented efficiently, a series of interior walls in both the longitudinal and transverse direction must be “stacked” between the first and second levels to provide continuous load paths to the foundation. In addition at the front and rear exterior walls one or more of the wall segments must have a height to width ratio no greater than 2:1 between each framing level for plywood shear walls to be utilized.

The ideal site for these types of structures is a relatively flat site with soils suitable for typical continuous shallow reinforced concrete footings with a concrete slab-on-grade. Sites with expansive or liquefiable soils should be avoided if possible. Sites subject to flooding should be avoided.

III. Option B: New Living Quarters/Offices Building and Renovate Apparatus Building at Prescadero Creek Road Site

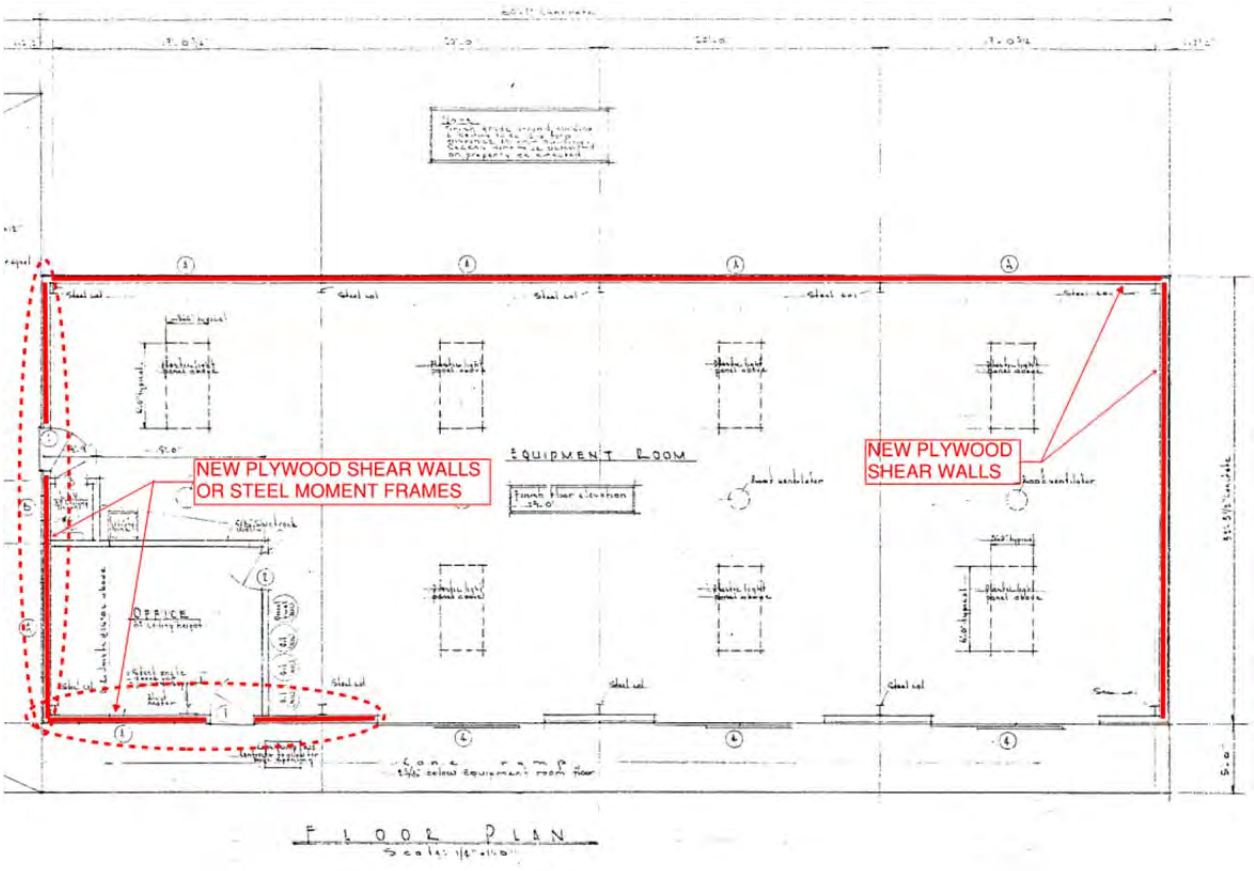
The structural system narrative is based on the concept architectural plans shown on this page. The new Living Quarters/Office portion of the structure is assumed to be the same layout as Option A.

The station would consist of two separate building structures: new Office/Living Quarters and renovated Apparatus.

The structural gravity system for the Office/Living Quarters structure consists of light gauge or wood joists at the roof and floor levels. The joists at both levels are supported by light gauge or wood stud interior and exterior bearing walls. Roof joists span the transverse direction and are supported on interior corridor walls as required. The direction of floor joists framing is dependent on the Level One wall layout. As an alternate to roof and floor joists, trusses can be utilized at both levels. The lateral system in both transverse and longitudinal directions consists of plywood shear walls. Plywood roof and floor diaphragms are used to transfer seismic forces to the lateral system. For both gravity and lateral systems to be implemented efficiently, a series of interior walls in both the longitudinal and transverse direction must be “stacked” between the first and second levels to provide continuous load paths to the foundation. In addition at the front and rear exterior walls one or more of the wall segments must have a height to width ratio no greater than 2:1 between each framing level for plywood shear walls to be utilized.

With minor modifications the existing apparatus building should have a gravity system capability of meeting the requirements for Immediate Occupancy as described previously. However, the existing

structure lacks a lateral system adequate to meet the requirements of Immediate Occupancy for Emergency Response building occupancies. As described in the existing apparatus building evaluation the structure is a single-story, pre-engineered and pre-fabricated steel building. In general this type of system is designed for maximum efficiency of material and cost and not for a high performance during seismic events. Therefore, the existing lateral system will be abandoned in place and allowing the steel frames to remain as the primary gravity system only. A new lateral system will supersede the existing system. The new system will consist of plywood shear walls on as many as four sides of the structure over new light gauge or wood stud exterior walls. Depending on the height to width ratios of the new shear walls, the existing foundation may be determined to be adequate if the ends of the walls terminate at steel column locations. At the front and left side of the structure new steel moment frames may need to be installed to resist lateral forces if the existing window and door openings cannot be modified to allow for plywood shear walls to be utilized. New foundation elements will be required at steel moment frame locations. Plywood roof diaphragm will be used to transfer seismic forces to the new lateral system.



8.3 Mechanical, electrical, and plumbing report

NBA ENGINEERING, INC.

San Francisco * Oakland * Los Angeles

Fire Station at 1200 Pescadero Creek Rd, Pescadero, CA
Investigative Study for Mechanical & Electrical Systems

Bill Blessing
Ratcliff Architects
5856 Doyle Street
Emeryville, CA 94608

I. Existing Conditions:

A. Electrical Systems Existing Conditions

Currently, the fire station consists of four buildings: the Living Quarters, the Apparatus Building, the Pump Room, and the Generator Room. The entire station's power is provided by a pole-mounted, PG&E 15KVA, single-phase transformer. The service to the four buildings is a 120/240V, 1PH, 3-wire system. In addition, there is a 50 KW/62.5 KVA diesel fuel standby generator with an automatic transfer switch to provide power in case of emergency. Most of the electrical equipment, including the standby generator (see EE2), and automatic transfer switch (see EE3), has been in use for more than thirty years. The coastal climate, severe weather conditions, and some flooding have caused rusting of the enclosed outdoor service entrance equipment (see EE1). Some of the equipment covers are missing or broken. The existing storage room panel board is very old and rusted (see EE1). The amperage in the exercise room is not adequate to run the exercise equipment. There is no security camera or intrusion detection system in this facility.

The following lighting installations have been observed in the field:

1. There are smoke detectors missing from the bedrooms.
2. Due to years of operation, the translucent acrylic prismatic fluorescent fixture diffusers have become discolored at the center/edge of the luminaire (see EE5).
3. Most of the fluorescent fixtures are equipped with 40-watt lamps, which are considered obsolete. The current standard for fluorescent lamps with electronic ballast is a rating of 32 watts.
4. Building door lights and fixtures at the Living Quarters are equipped with 60-watt incandescent lamps. One wall mounted light in the Living Quarters is broken (see EE6). Incandescent lamps consume more energy and provide less illumination than compact fluorescent lamps.
5. There are five high-wattage security HID flood lights on the building roof that consume a great deal of electricity when in use.
6. There are three 25-inch diameter HID fixtures, plus eight 2 lamp, 1'x4' industrial-type fluorescent fixtures in the Apparatus Building. All fixtures are ceiling-mounted. There is a time delay due to lamp warm up when the HID lights are turned on. This hampers operation and maintenance of the vehicles.

Miscellaneous Findings:

1. Most of the receptacles inside all three buildings are worn, having been in use for many years. Some are discolored. They need to be replaced.
2. Ceiling-mounted, battery-powered smoke detectors have been found in some rooms. Some rooms lack these smoke detectors, particularly in Living Quarters.
3. Sump pump power and control equipment is located outdoors in a wooden cabinet adjacent to the Headquarters building. The enclosures show rust.

B. Mechanical Systems Existing Conditions

There is no gas or sewer piping to these buildings. There is an underground septic tank for black water. The septic tank floods periodically, requiring station personnel to rent and use portable toilet facilities when the septic system is being repaired and cleaned.

A propane tank provides gas to these buildings. The kitchen oven runs on propane. There is an old propane domestic water heater serving showers and lavatories in the Living Quarters (see ME1). There is rust on the 500 gallon propane tank and the dual fuel tank (1000 gallon diesel and 500 gallon unleaded gasoline), probably due to flooding. The fuel tank appears leak (see ME3 and ME5).

An old, forced-air propane furnace serves the Living Quarters, (see ME2). The ductwork lacks insulation. There are no heating ducts to some of the rooms in the Living Quarters. There is no indication of mechanical ventilation in either the Living Quarters or in the Apparatus Building. There are no fire sprinkler and no fire alarm systems. A large proportion of the equipment is rusted, possibly due to salt water.

The available utilities are Pescadero Community Water System, which provides potable water, and Pacific Gas & Electric providing power. A well on the hill above the site has a holding tank that feeds the stand pipe. It provides non-potable water.

There is a 240-volt air compressor for shop air requirements/Apparatus Building, which is aged. There are three overhead exhaust systems with control boxes on the wall in the Apparatus Building. This building has no fire alarm or fire sprinkler. There is an antiquated bathroom and sink and in the Apparatus Building.

Heat for the Apparatus Building is provided by an old, propane-fired, Reynar unit heater, (see ME6), which has some rusted piping and no insulation on the exhaust flue. There is no heat in the Apparatus Building office areas. The engine area of the Apparatus Building is too small and too proximate to the roll up door. Existing HVAC control systems are localized via thermostat.

II. Option A- New, Single-Building, Fire Station Site

A. Electrical System

A new site will require a 120/240 VAC, single phase, 3 wire power distribution system. A new service transformer shall be provided and installed by the utility company (PG&E) to meet new load requirements. The new utility transformer shall be either the pole mounted or the pad mounted type. Building lighting will be served by a 120 or 208 VAC single phase system. Receptacles shall be served with 120 VAC system. A standby diesel generator and automatic transfer switch shall be provided for emergency power outages.

List of desirable electrical items in an ideal site:

1. New utility company service transformer,
2. Service entrance panel board with utility meter socket,
3. Two power distribution panel boards, one located in Level 1 and the other located in Level 2,
4. New standby diesel generator and associated automatic transfer switch,
5. Addressable fire alarm system for the building
6. CCTV/security systems for the building
7. Telephone system for the building
8. LED type security floodlights for the new building and surrounding areas.
9. An energy management system to control HVAC systems.

B. Mechanical Systems

The building shall be provided with HVAC systems consistent with the design conditions in order to maintain occupants' comfort and functional requirements. Heating and ventilating units and exhaust fans for different zones shall be provided to supply heating and ventilation to the apparatus room , electrical room, dorms, lounge, kitchen, dining, corridors, toilets, shower room, and janitor storage. One split-system heat pump unit per zone will be provided to serve the office area that includes areas for secretary, reception, corridor, and storage. A ductless, split heat pump unit shall be provided to serve the physical training area. Make-up air unit and exhaust fans shall be provided for the engine exhaust in the apparatus room.

The HVAC systems will be equipped with local digital thermostats. Kitchen shall be provided with state-of-the-art exhaust hood and a stove, refrigerator, dish washer, dual-sink, and a garbage disposal.

A. Plumbing Systems

The building plumbing fixtures will include low-flow water closets, urinals, and lavatories; showers, sinks, floor drains, trap primers, hose bibs, roof drains, overflow drains, washing machine hook-up or drains, trench drains, area drains, and filtered water system. One high-efficiency, central, gas-fired, water heater shall be provided to supply domestic hot water for the showers, lavatories, and sinks. A circulating pump will be installed to maintain hot water at the point of use. A compressed-air system with a refrigerated dryer shall be provided to supply compressed air to the apparatus room. A double wall fuel storage tank for diesel and unleaded gasoline fuels will be provided. The fuel storage tanks shall be

equipped with leak detection sensors and monitoring units. All utilities, gas, water, sewer, storm, and fire water to be piped from city/county systems.

III. Option B- Keep Existing Site , New Living Quarters over Offices, Modify Apparatus Building

A. Electrical System

Power distribution system shall be a 120/240VAC, single phase, 3 wire system. It is recommended that a new service transformer shall be provided and installed by PG&E to replace the existing one. Building lighting will be served by a 120 or 208VAC single phase system .Receptacles will be served by a 120VAC system. A standby diesel generator and automatic transfer shall be provided to replace the existing ones.

List of electrical items to be demolished

1. Existing pole-mounted utility transformer,
2. Existing service entrance panel board with utility meter,
3. Existing panel board “ILEC”,
4. Existing diesel standby generator and associated automatic transfer switch,
5. All fluorescent fixtures inside the existing buildings,
6. All building door/outside wall-mounted incandescent light fixtures,
7. All lighting fixtures inside Apparatus Building,
8. All roof-mounted HID floodlights,
9. All conduit, wires, junction boxes associated with demolition items.

B. Mechanical Systems

The buildings shall be provided with HVAC systems consistent with the design conditions in order to maintain occupants’ comfort and functional requirements. Heating and ventilating units and exhaust fans for different zones shall be provided to supply heating and ventilation to the apparatus room , electrical room, dorms, lounge, kitchen, dining, corridors, toilets, shower room, and janitor storage. One split-system heat pump unit per zone will be provided to serve the office area that includes areas for secretary, reception, corridor, and storage. A ductless, split heat pump unit shall be provided to serve the physical training area. Make-up air unit and exhaust fans shall be provided for the engine exhaust in the Apparatus Building.

The HVAC systems will be equipped with local digital thermostats. Kitchen shall be provided with state-of-the-art exhaust hood and a stove, refrigerator, dish washer, dual-sink, and a garbage disposal.

C. Plumbing Systems

The buildings’ plumbing fixtures will include low-flow water closets, urinals, and lavatories; showers, sinks, floor drains, trap primers, hose bibs, roof drains, overflow drains, washing machine hook-up or drains, trench drains, area drains, and filtered water system. One high-efficiency, central, gas-fired, water heater shall be provided to supply domestic hot water for the showers, lavatories, and sinks. A circulating pump will be installed to maintain hot water at the point of use. A compressed-air system with a refrigerated dryer shall be provided to supply compressed air to the Apparatus Building. A double wall

fuel storage tank for diesel and unleaded gasoline fuels will be provided. The fuel storage tanks shall be equipped with leak detection sensors and monitoring units.

List of mechanical and plumbing items to be demolished

1. All the HVAC equipment: furnace, toilet exhaust fans, kitchen hood exhaust fan, and distribution systems (ductwork, diffusers, exhaust grills, etc.) and controls (thermostat) for the Living Quarters shall be demolished and discarded;
2. The existing unit heater and associated piping and exhaust flue in the Apparatus Building shall be demolished and discarded;
3. All existing lavatories and water closets and kitchen sink in the Living Quarters and lavatory and water closet area shall be demolished and discarded;
4. Demolish and discard existing dual fuel tank,
5. Remove and discard existing propane tank,
6. Remove and discard existing air compressor.

ME1 – Water heater and furnace

ME2 – Gas furnace

ME3 – Liquid fuel tank

ME4 – Non-potable water connection

ME5 – Propane fuel tank

ME6 – Gas unit heater

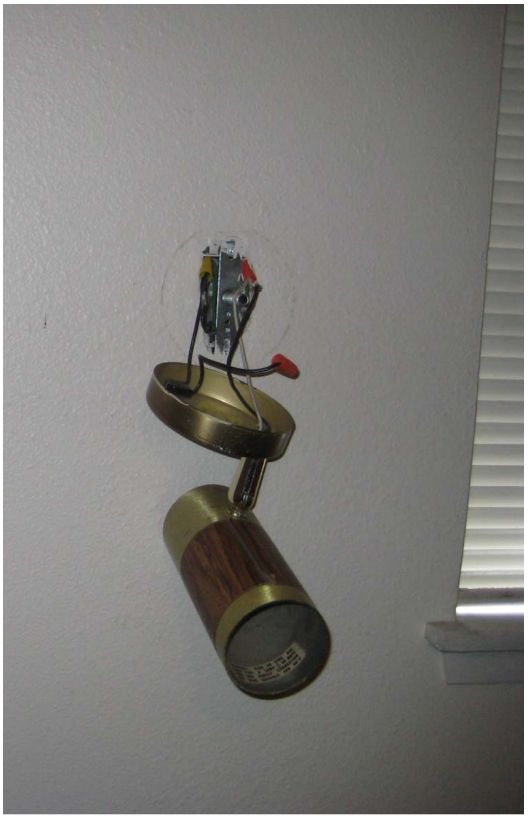
EE1 – Fire Station entrance equipment cabinet

EE2 – Single phase diesel fuel standby generator

EE3 – Automatic transfer switch

EE4 – Storage Room panel

EE5 – Living quarters corridor lights



EE6 – Damaged light, Living Quarters

Introduction

The San Mateo County Fire Station located at 1200 Pescadero Creek Road in Pescadero, CA (Pescadero Fire Sta.) consists of four buildings on a 1.3 acre site. According to the contract drawings and as-builts, the station was originally constructed in 1957 with various improvements made since that time. The site is located within the flood plain which creates a number of issues which will be discussed below. The site and buildings are outdated and in need of improvement, either at the existing site, or at a new site, in order to meet current standards and to adequately serve its community.

Existing Conditions

As mentioned above, the Pescadero Fire Sta. is located in the flood plain of the Butano Creek (see "Pescadero Floodway Map" attached. The site is has experienced an increase in the occurrence of flooding since the mid 1980's due to the accumulation of silt and debris in Butano Creek and Pescadero Marsh as a result of halted dredging operations. It is reported that the site floods at least once a year with as much as three feet of water reported in 1998. Pescadero Creek Road also floods during these events. As such, the Pescadero Fire Sta. staff relocates to alternative sites during heavy rains so that they can maintain their ability to respond to emergency events.

Civil utilities on-site consist of domestic water served by the local water service municipality. Additionally, there is an on-site well used for non-potable water needs (i.e. to supply the existing wharf hydrant), and a septic system for the disposal of site generated sewage waste. The septic system is reported to back-up during flood events, which is to be expected considering the ground would be saturated during these events and would have no additional hydraulic capacity. The system was constructed along with the rest of the site in 1957. Considering the age of the system, it is unlikely that it meets current code. Additionally, septic systems have an average lifespan of 25 years. As such, it is likely that the system at the Pescadero Fire Sta. has reached the end of its useful life, though it would have to be tested to confirm this.

Option A. New Fire Station / Idealized Site

The selected site should be one that is located at an elevation that is above the flood plain with additional vertical elevation to allow for sea level rise. Additionally, the road(s) leading to and from the fire station should be similarly above flood elevations to maximize, as much as possible, access to the community during flood events. There shall also be adequate space on-site to provide for State and local storm water treatment requirements.

Domestic water shall be provided by the local water service municipality if available at the selected location. If municipal water is unavailable at the selected location, there must be adequate potable well water available to serve the new fire station's needs.

In absence of any municipal sewer system, the sewage disposal needs will need to be met with an on-site septic system that meets current code. As such, there must be adequate space and soil conditions to accommodate this.

Option B. Keep Pescadero Creek Rd Site: New Living Quarters over Offices, Renovate Apparatus Bldg.

In this scenario, the existing residence building will be demolished and relocated to a new two story addition adjacent to the existing apparatus building. The new addition must be constructed such that the finished floor elevation of the first level is above the flood elevation with additional vertical elevation clearance to allow for sea level rise. The existing apparatus building, however, may be at an elevation that is below future flood elevations as sea level rise continues. As such, this building may experience flooding in the future. A new driveway access will be constructed to Bean Hollow Road at the south-east side of the site which is at a higher elevation than the existing access from Pescadero Creek Road. This will improve access during flood events, though access to Pescadero Creek Road will still be limited due to flooding. Space will also have to be dedicated on-site to meet State and local storm water treatment requirements. The location of the existing residence would be a likely alternative for this.

The new addition is likely to be situated such that a portion of the existing hillside will have to be excavated to accommodate the structure. As such, a new retaining wall will need to be constructed along with adequate drainage facilities to capture hillside runoff.

Domestic water will continue to be served by the local water service municipality.

A new septic system will likely be required. The location of the existing system would be the ideal location if it has adequate space and soil conditions to accommodate a system that meets current code. Due to the likelihood of high groundwater at the location of the existing system, a shallow pressure dosing system would likely be required. However, because this location becomes inundated with water during flood events (see Photo 1), it is unlikely that this location will meet code. As such, alternative locations on site should be considered such as the western side of the site or on the hillside along the southern end of the site. It is unlikely, however, that the southern end will be feasible due to the steep slope and the confined area.

Septic field with flood elevation marker (white post with red marks) shown in the background

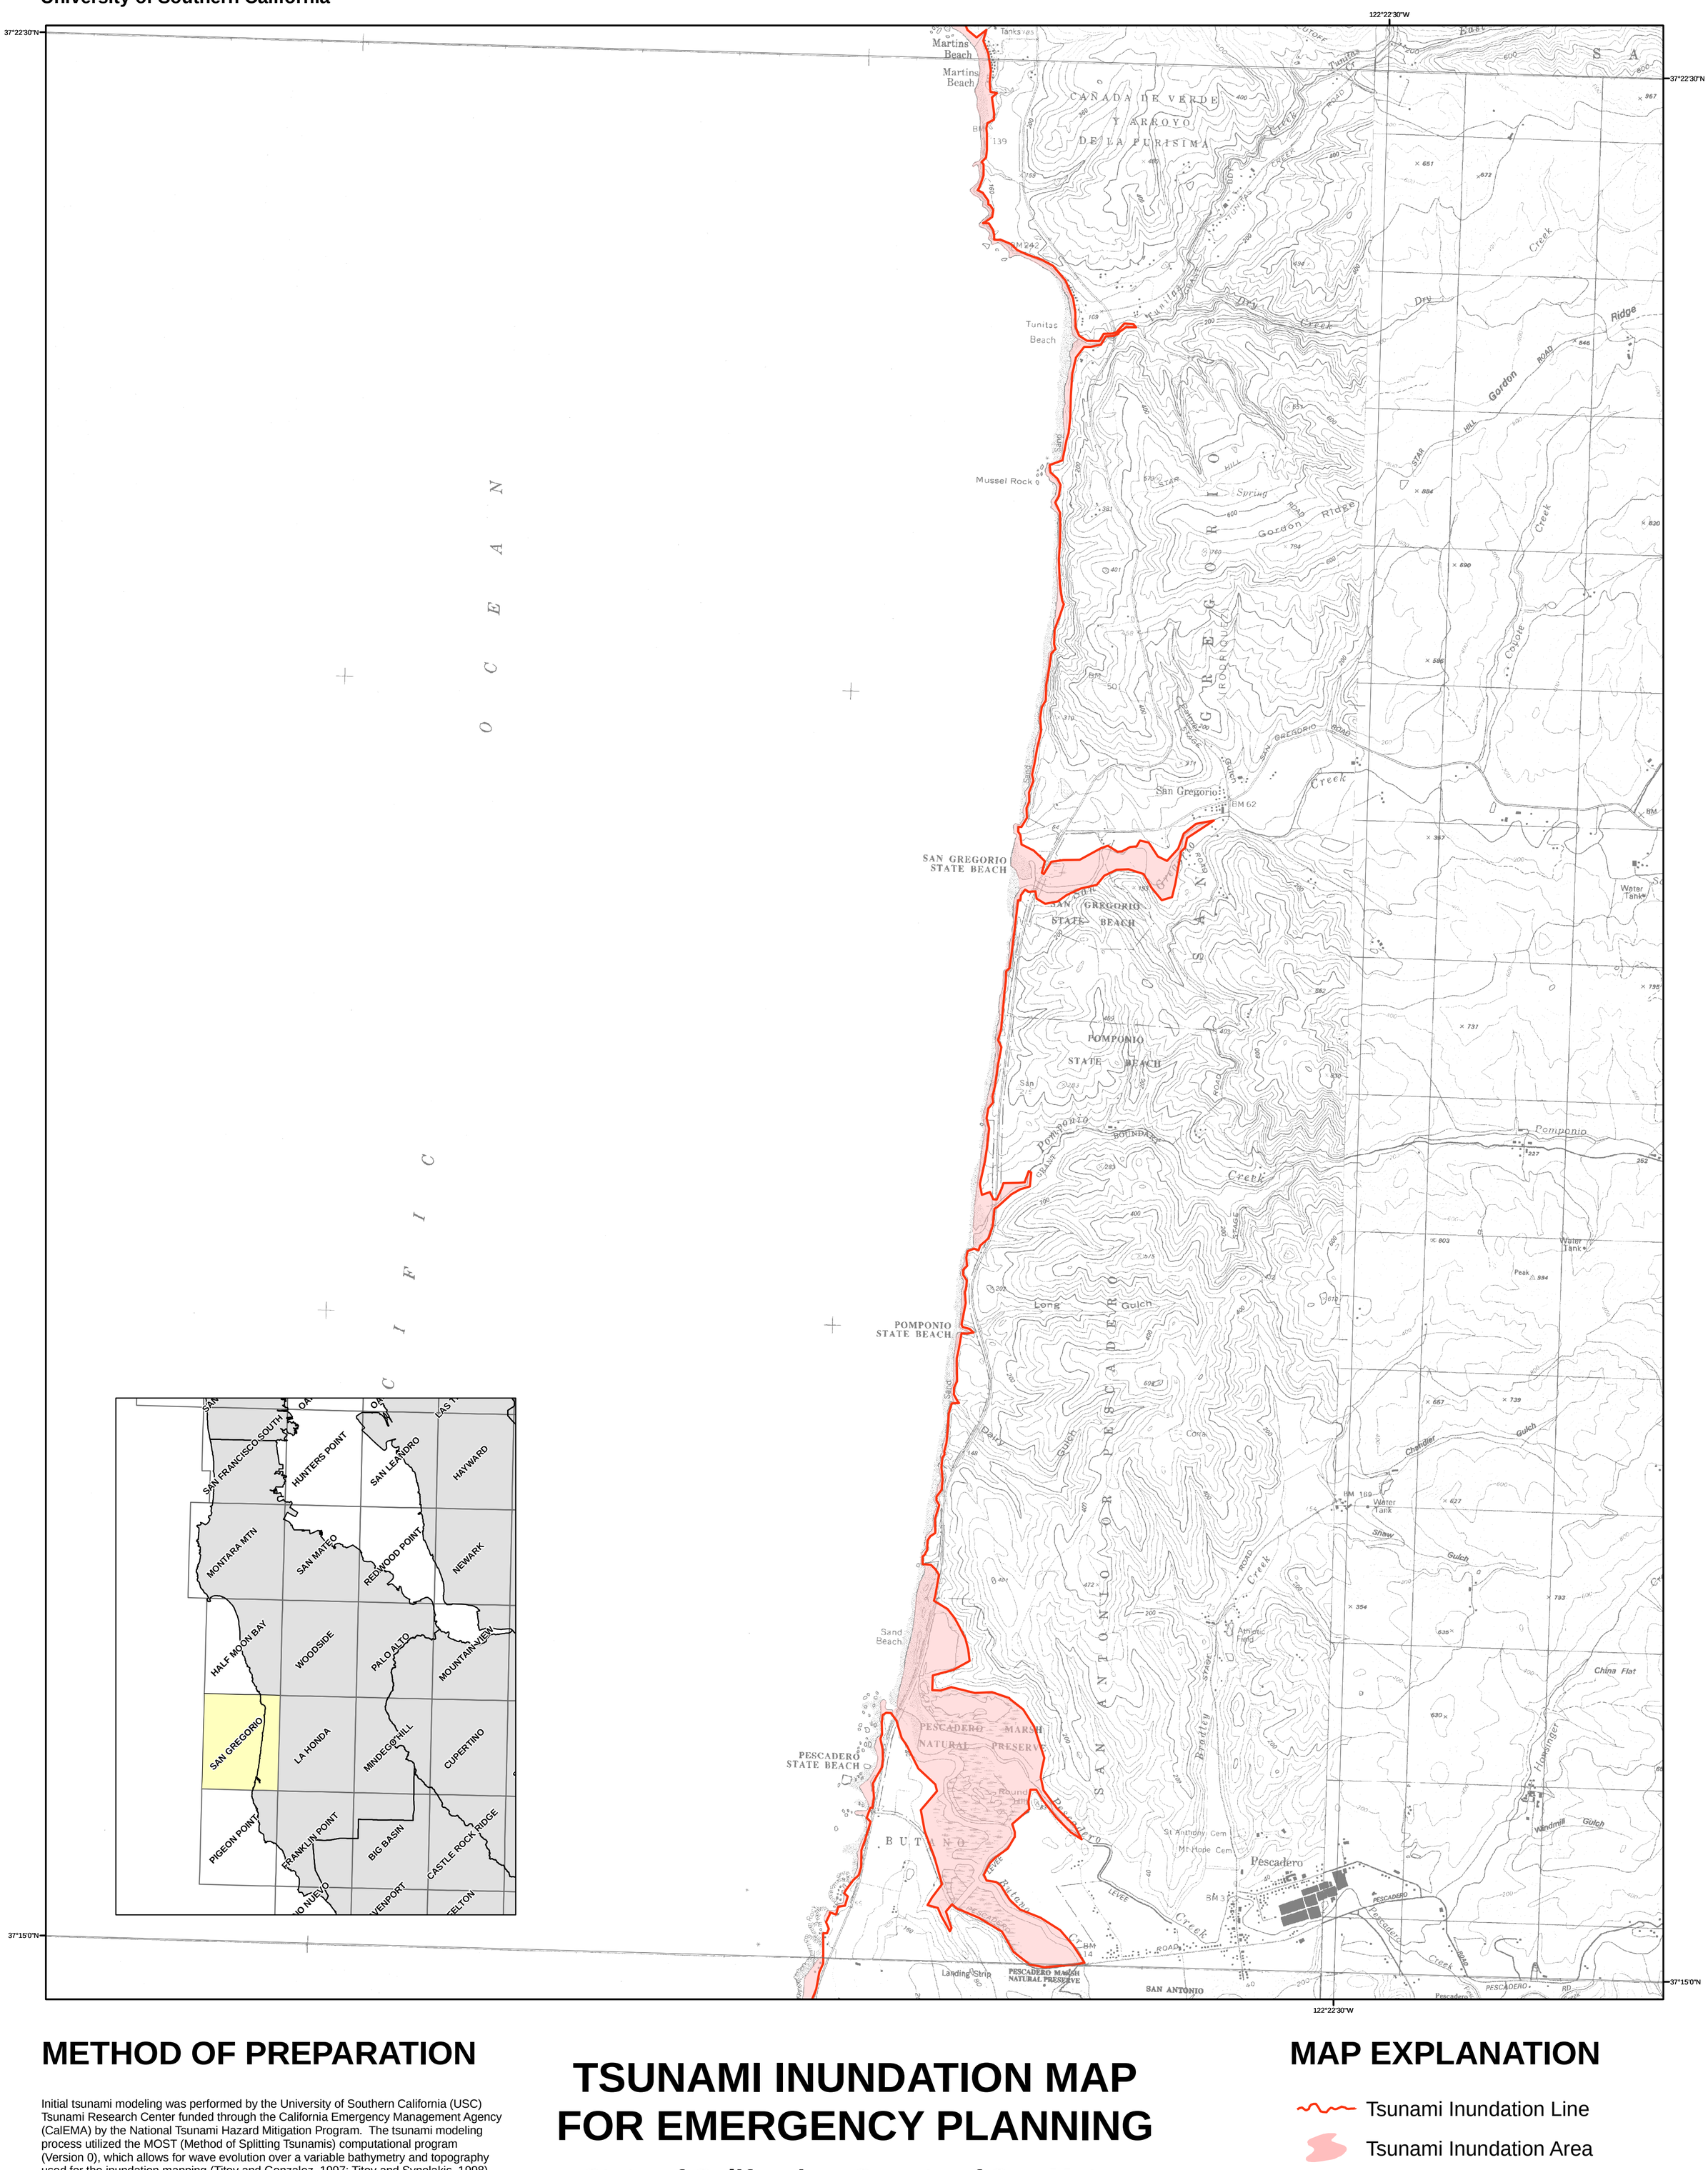
Tsunami Inundation Map for Emergency Planning
San Gregorio Quadrangle

State of California
County of San Mateo



METHOD OF PREPARATION

Initial tsunami modeling was performed by the University of Southern California (USC) Tsunami Research Center funded through the California Emergency Management Agency (CalEMA) by the National Tsunami Hazard Mitigation Program. The tsunami modeling process utilized the MOST (Method of Splitting Tsunamis) computational program (Version 0), which allows for wave evolution over a variable bathymetry and topography used for the inundation mapping (Titov and Gonzalez, 1997; Titov and Synolakis, 1998).

The bathymetric/topographic data that were used in the tsunami models consist of a series of nested grids. Near-shore grids with a 3 arc-second (75- to 90-meters) resolution or higher, were adjusted to "Mean High Water" sea-level conditions, representing a conservative sea level for the intended use of the tsunami modeling and mapping.

A suite of tsunami source events was selected for modeling, representing realistic local and distant earthquakes and hypothetical extreme undersea, near-shore landslides (Table 1). Local tsunami sources that were considered include offshore reverse-thrust faults, restraining bends on strike-slip fault zones and large submarine landslides capable of significant seafloor displacement and tsunami generation. Distant tsunami sources that were considered include great subduction zone events that are known to have occurred historically (1960 Chile and 1964 Alaska earthquakes) and others which can occur around the Pacific Ocean "Ring of Fire."

In order to enhance the result from the 75- to 90-meter inundation grid data, a method was developed utilizing higher-resolution digital topographic data (3- to 10-meters resolution) that better defines the location of the maximum inundation line (U.S. Geological Survey, 1993; Intermap, 2003; NOAA, 2004). The location of the enhanced inundation line was determined by using digital imagery and terrain data on a GIS platform with consideration given to historic inundation information (Lander, et al., 1993). This information was verified, where possible, by field work coordinated with local county personnel.

The accuracy of the inundation line shown on these maps is subject to limitations in the accuracy and completeness of available terrain and tsunami source information, and the current understanding of tsunami generation and propagation phenomena as expressed in the models. Thus, although an attempt has been made to identify a credible upper bound to inundation at any location along the coastline, it remains possible that actual inundation could be greater in a major tsunami event.

This map does not represent inundation from a single scenario event. It was created by combining inundation results for an ensemble of source events affecting a given region (Table 1). For this reason, all of the inundation region in a particular area will not likely be inundated during a single tsunami event.

MAP EXPLANATION

Tsunami Inundation Line

Tsunami Inundation Area

PURPOSE OF THIS MAP

This tsunami inundation map was prepared to assist cities and counties in identifying their tsunami hazard. It is intended for local jurisdictional, coastal evacuation planning uses only. This map, and the information presented herein, is not a legal document and does not meet disclosure requirements for real estate transactions nor for any other regulatory purpose.

The inundation map has been compiled with best currently available scientific information. The inundation line represents the maximum considered tsunami runup from a number of extreme, yet realistic, tsunami sources. Tsunamis are rare events; due to a lack of known occurrences in the historical record, this map includes no information about the probability of any tsunami affecting any area within a specific period of time.

Please refer to the following websites for additional information on the construction and/or intended use of the tsunami inundation map:

MAP BASE

Topographic base maps prepared by U.S. Geological Survey as part of the 7.5-minute Quadrangle Map Series (originally 1:24,000 scale). Tsunami inundation line boundaries may reflect updated digital orthophotographic and topographic data that can differ significantly from contours shown on the base map.

DISCLAIMER

The California Emergency Management Agency (CalEMA), the University of Southern California (USC), and the California Geological Survey (CGS) make no representation or warranties regarding the accuracy of this inundation map nor the data from which the map was derived. Neither the State of California nor USC shall be liable under any circumstances for any direct, indirect, special, incidental or consequential damages with respect to any claim by any user or any third party on account of or arising from the use of this map.

Meeting Minutes

Meeting Date: November 20, 2013
Meeting time: 9:30 am

Meeting No.: 2

Project: Pescadero Fire Station (PFS) Assessment Study
Pescadero, CA
Ratcliff Project No: 32053.00

Place: Pescadero Fire Station

Attendees:

Name

Bill Blessing, Ratcliff
Nina Pakanant, Ratcliff
Scott Ernest, PFS
Robert Pierson, PFS
Andy Cope, PFS
Guido Misculin, San Mateo County
Theresa Yee, San Mateo County

Meeting Minutes:

Item		Agenda topic	Action	Due Date

1		**Existing Drawings**
		- Ratcliff received existing drawings of the Apparatus Building.
		- Current fire station service coverage:
		  ○ North boundary – Tunitas Creek Rd.
		  ○ East boundary – Hwy 84
		  ○ South boundary – Cloverdale Rd.
		- Ratcliff needs a Service Area map.		

2		**Ratcliff Presentation** - Presented example of stations from Chico Airport Fire Station, Yuba City Fire Station, and Emeryville Fire Station. - Proposed new site in Town of Pescadero is also in the flood zone. - San Mateo OES can provide Tsunami plan.		
3		**Issues with current fire station location** - During seasonal flood, an engine from Station 17 is sent to a site nearby high school. A temporary modular trailer is set up at the fire station. - Chemical run off contaminates rain water. - Response plan includes Engine 40 from Half Moon Bay and Station 55 (volunteer).	.	
4		**Staffing** - Under normal budget, the station has 4 staff (2 rescuers, 2 engine staff). Under the budget cut, the station has 3 engine staff and 1 supplemental rescuer. - Maximum staff is 9. This occurs approximately 8 times per		

		year. - Fire season is between: May 15 – Nov. 1. When maximum staffing typically occurs. - During off-season: 3-4 staff - Typical shift: 3 work days. 4 off days.		
5		**Site** - Currently the overall storage space is insufficient. The shed and shipping container houses landscaping tools and emergency supplies. - Current above grade dual fuel tank is rusting and has some leaks. - Original underground tank had been dug out. (soil contamination ?) - Well water is used for the Apparatus and hydrants. The Living Quarters uses potable city water. - Current emergency power generator is pre 1983. - PFS is ok with 72 hr generator. Ratcliff to confirm size needed. - Need a wharf hydrant. - Hose rack is antiquated. Prefer modern hose dryer.		
6		**Apparatus Bay** - Current engines: (1) Type 1 engine, (1) rescue 59, (1) seasonal Type 3, (1) utility pick-up truck, (1) water tender - Prefer solution for adjacency among decontamination, turn-out room, and extractor equipment spaces. - Currently turnout gear is on sides and rear of Apparatus bays, and is circulation around vehicles is reduced. - Need sizable medical storage due to the variety of incident types required: coastal waters, coastal cliffs, highway, forest, town. - Ratcliff needs make and model of the engines for planning. - Staff performs minor station repairs on site, others by County mechanics. - Need washing apparatus pad. Prefer indoor. Underside spray needed due to salt vapor within coastal areas. - Currently no oil disposal set up. - Need to accommodate 11'-3" high truck at this time. - Rear addition (date:?) includes area for physical training. - Area is insufficient and not efficiently laid out. At present – no daylight and area is mixed with vehicle bay air systems.		
7		**Public/ Office** - PFS prefers having a lobby/office area to receive visitors. - Office space requirements: (2) workstations, (1) EMS workstation, (1) captain's office - Guido requested Ratcliff to present an option of having Emergency Operation Center function. - Prefers having spaces to accommodate public meetings and training (e.g. PMAC Meeting and voting) - Current EMS training takes place at Station 40. - Outdoor training takes place at PFS. - Deliveries: occasional big deliveries. - Need public restroom.		

8		**Living Quarters** - Existing beds: 7. - During training, living facility is insufficient. Would prefer to provide separate gender bathrooms and bedrooms. - Prefer Day Room to have separation from Dining and Kitchen - Kitchen size is currently sufficient. Would like to have commercial-grade dish washer. - Current pantry storage space insufficient. - Dining table some time is used for meetings. During having maximum staffing, some people dine in the Day Room. - Outdoor patio needs wind and insect screen protection in the coastal area. - Prefer commercial-grade washer and dryer.		
9		**Programming Report** - Ratcliff to explore possibly 4 options: o Option A: Renovating existing fire station – occupied site (need phased planning) o Option B: Renovation existing fire station – unoccupied site (need temp site) o Option C: : Renovation existing fire station – with a remote mini station concept. (need remote site) o Option D: New fire station at a new location (need new site TBD). - Ratcliff to incorporate sustainable features.		
10		**Aesthetic** - Not deeply discussed, but some preference for association with local rural structures was mentioned.		

These minutes summarize the conclusions of the subject meeting. If there are substantial errors or omissions, please contact Ratcliff within three working days of receipt of this memorandum

Nina Pakanant

The 2010 Forest and Range Assessment: Final Document

http://frap.fire.ca.gov/data/assessment2010/pdfs/california_forest_assessment_nov22.pdf

This assessment highlights key issues, resource status and trends and priority landscapes for the subsequent strategy document, which will provide a framework for state and federal programs to support good forest and rangeland stewardship in California.

Chapter 3.7 Climate Change: Threats and Opportunities. A variable pattern of annual precipitation is expected; increasing through 2069, then followed by a large decrease by 2099.

California Coastal Commission Draft Sea-Level Rise Policy Guidance. Public Review Draft.

http://www.coastal.ca.gov/climate/slr/guidance/CCC_Draft_SLR_Guidance_PR_10142013.pdf

Page 5 of the document, showing projected sea level rise, is included below.

Table 1. NRC Sea-Level Rise Projections for California (NRC, 2012)

TIME PERIOD	NORTH OF CAPE MENDOCINO	SOUTH OF CAPE MENDOCINO
2000 – 2030	-4 – +23 cm (-1.56 – 9 inches)	4 – 30 cm (1.56 – 11.76 inches)
2000 – 2050	-3 – + 48 cm (-1.2 – 18.84 inches)	12 – 61 cm (4.68 – 24 inches)
2000 – 2100	10 – 143 cm (3.6 – 56.28 inches)	42 – 167 cm (16.56 – 65.76 inches)

Could be 24" rise within 50-year lifespan of New Fire Station

In addition to these sea-level rise projections, the 2012 NRC report provides information on the impacts of sea-level rise in California. According to the report, sea-level rise will cause flooding and inundation, an increase in coastal erosion, changes in sediment supply and movement, and saltwater intrusion to varying degrees along the California coast. These effects in turn could have a significant impact on the coastal economy and could put important coastal resources and coastal development at risk, including ports, marine terminals, commercial fishing infrastructure, public access, recreation, wetlands and other coastal habitats, water quality, biological productivity in coastal waters, coastal agriculture, and archeological and paleontological resources.

PRINCIPLES FOR ADDRESSING SEA-LEVEL RISE IN THE COASTAL ZONE

This guidance is rooted in certain fundamental guiding principles, many of which derive directly from the requirements of the Coastal Act. In this respect, the principles are not new, but rather generally reflect the policies and practices of the Commission since its inception in addressing coastal hazards and the other resource and development policies of the Act. Each of the four groups of principles below embodies important concepts that are specifically and increasingly raised by the challenges of rising sea levels. This guidance builds on the cumulative knowledge and experience of the agency to help identify practical guidance for addressing sea-level rise in the California coastal zone, consistent with these principles and the statewide policies of the California Coastal Act.

A. Use Science to Guide Decisions [Coastal Act Sections 30006.5; 30335.5]

1. Acknowledge and address sea-level rise as necessary in planning and permitting decisions.
2. Use the best available science to determine locally relevant (context-specific) sea-level rise projections for all stages of planning, project design, and permitting reviews.
3. Recognize scientific uncertainty by using scenario planning and adaptive management techniques.

B. Minimize Coastal Hazards through Planning and Development Standards [Coastal Act Sections 30253, 30235; 30001, 30001.5]

4. Avoid significant coastal hazard risks where feasible.
5. Minimize hazard risks to new development over the life of authorized structures.
